12a. DISTRIBUTION AVAILABILITY STATEMENT Approved for public release: distribution is unlimited			12b. DISTRIBUTION CODE	
13. ABSTRACT (Maximum 200 words) Site 2-Pesticide Pit Burial Area was investigated under the Installation Restoration Program. A removal action was conducted in 1988, when pesticide containers and contaminated soil were excavated from the pit. The pit covered an area of approximately 1000 square feet and was approximately 12 feet deep. The report recommends no further action based on study results.

APPENDIX B

FIELD CHANGE REQUESTS

FIELD CHANGE REQUEST FORM

1. Field Change No. 1

2. Page 1 of 1

3. PROJECT STEWART ANG BASE - SITE 2

4. PROJECT NUMBER _____

5. APPLICABLE DOCUMENT _____

6. DESCRIPTION OF CHANGE:

GROUNDWATER MONITORING WELL MW-13 WAS INSTALLED
AND SAMPLED IN ADDITION TO PROPOSED MONITORING WELLS.

7. REASON FOR CHANGE:

AS MW-02 AND MW-03 WERE NOT INSTALLED, MW-13 WAS
ADDED TO FACILITATE SAMPLING AND ANALYSIS OF OVERBURDEN
GROUND WATER

8. RECOMMENDED DISPOSITION:

9. PRESENT & COMPLETED WORK IMPACT:

MW-13

10. REQUESTED BY:

Michael Plant
Field/Project Manager

7/10/96
Date

11. FINAL DISPOSITION:

12. APPROVAL:

NGB Project Manager

Date

FIELD CHANGE REQUEST FORM

1. Field Change No. 2

2. Page 1 of 1

3. PROJECT STEWART ANG BASE - SITE 2

4. PROJECT NUMBER _____

5. APPLICABLE DOCUMENT _____

6. DESCRIPTION OF CHANGE:

PROPOSED GROUND WATER MONITORING WELLS MW-02 AND
MW-03 WERE NOT INSTALLED

7. REASON FOR CHANGE:

IMMUNO ASSAY SCREENING OF SOILS COLLECTED FROM THESE
LOCATIONS INDICATED THE PRESENCE OF PESTICIDES. AS PER
ANG SITE INVESTIGATION PROTOCOL, THEY COULD NOT BE
INSTALLED

8. RECOMMENDED DISPOSITION:

9. PRESENT & COMPLETED WORK IMPACT:

MW-02 AND MW-03

10. REQUESTED BY:

Michael Blum
Field/Project Manager

7/10/96
Date

11. FINAL DISPOSITION:

12. APPROVAL:

NGB Project Manager

Date

FIELD CHANGE REQUEST FORM

1. Field Change No. 3

2. Page 1 of 1

3. PROJECT STEWART ANG BASE - SITE 2

4. PROJECT NUMBER _____

5. APPLICABLE DOCUMENT _____

6. DESCRIPTION OF CHANGE:

THREE SOIL SAMPLES WERE COLLECTED FROM THE SOIL
BORING FOR MW-01 AND SUBMITTED TO THE OFFSITE
LABORATORY FOR CHEMICAL ANALYSIS.

7. REASON FOR CHANGE:

THIS WAS PERFORMED TO ENSURE AN ADEQUATE AMOUNT
OF SITE-SPECIFIC BACKGROUND DATA WERE OBTAINED

8. RECOMMENDED DISPOSITION:

9. PRESENT & COMPLETED WORK IMPACT:

INCREASED THE NUMBER OF BACKGROUND SAMPLES COLLECTED.

10. REQUESTED BY:

Michael Elum
Field/Project Manager

7/10/96
Date

11. FINAL DISPOSITION:

12. APPROVAL:

NGB Project Manager

Date

FIELD CHANGE REQUEST FORM

1. Field Change No. 4

2. Page 1 of 1

3. PROJECT STEWART ANG BASE - SITE 2

4. PROJECT NUMBER _____

5. APPLICABLE DOCUMENT _____

6. DESCRIPTION OF CHANGE:

A GROUND PENETRATING RADAR SURVEY WAS PERFORMED AND AN EXPLORATORY
TEST PIT WAS EXCAVATED TO CONFIRM THE LOCATION OF THE
FORMER PESTICIDE PIT LOCATION

7. REASON FOR CHANGE:

THE EM SURVEY WAS FOUND TO PROVIDE INCONCLUSIVE
RESULTS AS TO THE LOCATION OF THE BURIED "I" BEAMS

8. RECOMMENDED DISPOSITION:

9. PRESENT & COMPLETED WORK IMPACT:

ACHIEVED CONFIRMATION OF PIT LOCATION; THEREFORE
CONFIRMED APPROPRIATENESS OF SOIL BORING LOCATIONS

10. REQUESTED BY:

Michael Olsen
Field/Project Manager

7/10/96
Date

11. FINAL DISPOSITION:

12. APPROVAL:

NGB Project Manager

Date

FIELD CHANGE REQUEST FORM

1. Field Change No. 5
2. Page 1 of 1

3. PROJECT STEWART ANG BASE - SITE 2
4. PROJECT NUMBER _____
5. APPLICABLE DOCUMENT _____

6. DESCRIPTION OF CHANGE:

GLASSWARE FOR COLLECTION OF SOIL SAMPLES CHANGED TO:
1-20Z. WIDE MOUTH GLASS JAR FOR VOCs
1-80Z. WIDE MOUTH GLASS JAR FOR SVOC, PEST/PCB, TAL INORGANICS
1-20Z. GLASS JAR FOR T.O.C.
ALSO- STAINLESS STEEL LINERS ARE NOT BEING USED FOR
SUBSURFACE SOIL SAMPLE COLLECTION

7. REASON FOR CHANGE:

REQUIRED GLASSWARE FOR LAB TO PERFORM NYSDEC CLP ANALYSES
LINERS NOT USED BECAUSE CORE BARREL SAMPLER IS BEING USED
DUE TO HARDNESS OF MATERIAL

8. RECOMMENDED DISPOSITION:

9. PRESENT & COMPLETED WORK IMPACT:

ALL SOIL SAMPLES

10. REQUESTED BY:

Michael Blend
Field/Project Manager

10/18/95
Date

11. FINAL DISPOSITION:

12. APPROVAL:

NGB Project Manager

Date

FIELD CHANGE REQUEST FORM

1. Field Change No. 6

2. Page 1 of 1

3. PROJECT STEWART ANG BASE - SITE 2

4. PROJECT NUMBER _____

5. APPLICABLE DOCUMENT _____

6. DESCRIPTION OF CHANGE:

GROUND WATER MONITORING WELLS WILL BE CONSTRUCTED
AS 2" DIAMETER WELLS INSTEAD OF 4" WELLS

7. REASON FOR CHANGE:

WELLS TO BE INSTALLED WILL BE CONSISTENT WITH
EXISTING WELLS

8. RECOMMENDED DISPOSITION:

9. PRESENT & COMPLETED WORK IMPACT:

ALL GROUND WATER MONITORING WELLS

10. REQUESTED BY:

Michael Plunk
Field/Project Manager

10/10/95
Date

11. FINAL DISPOSITION:

12. APPROVAL:

NGB Project Manager

Date

FIELD CHANGE REQUEST FORM

1. Field Change No. 7

2. Page 1 of 1

3. PROJECT STEWART ANG BASE - SITE 2

4. PROJECT NUMBER _____

5. APPLICABLE DOCUMENT _____

6. DESCRIPTION OF CHANGE:

DURING BOREHOLE ABANDONMENT OF SOIL BORINGS WHICH PENETRATE WEATHERED SHALE, SAND WILL BE PLACED IN THE BOREHOLE WITHIN AND ABOVE THE WEATHERED SHALE ZONE AND THEN THE HOLE IS TO BE GROUTED TO WITHIN APPROX. 1 FT OF GROUND SURFACE

7. REASON FOR CHANGE:

THIS IS DONE TO AVOID SIGNIFICANTLY ALTERING THE PH OF GROUND WATER BY ADDING BENTONITE GROUT IMMEDIATELY UPGRADIENT OF WELLS TO BE INSTALLED AND SAMPLED.

8. RECOMMENDED DISPOSITION:

9. PRESENT & COMPLETED WORK IMPACT:

SB-01, SB-06, SB-07

10. REQUESTED BY:

Michael Plend
Field/Project Manager

10/18/95
Date

11. FINAL DISPOSITION:

12. APPROVAL:

NGB Project Manager

Date

FIELD CHANGE REQUEST FORM

1. Field Change No. 8
2. Page 1 of 1

3. PROJECT STEWART ANG BASE - SITE 2

4. PROJECT NUMBER _____

5. APPLICABLE DOCUMENT _____

6. DESCRIPTION OF CHANGE:

DECONTAMINATION PROCEDURE CHANGED TO THE FOLLOWING
① ALCONOX RINSE ; ② TAP RINSE ; ③ RINSE W/ 10% HNO₃ FOR
STAINLESS STEEL ; 1% HNO₃ FOR CARBON STEEL ; ④ TAP RINSE ⑤ METHANOL
RINSE ; ⑥ AIR DRY ; ⑦ DI WATER RINSE ; ⑧ WRAP IN FOIL

7. REASON FOR CHANGE:

DECONTAMINATION PROCEDURE ALTERED TO FOLLOW EPA'S
REGION II DECONTAMINATION PROCEDURE

8. RECOMMENDED DISPOSITION:

9. PRESENT & COMPLETED WORK IMPACT:

ALL SAMPLING

10. REQUESTED BY:

Michael Plunk
Field/Project Manager

10/18/95
Date

11. FINAL DISPOSITION:

12. APPROVAL:

NGB Project Manager

Date

APPENDIX F, TABLE F-4
CALCULATED DECEMBER 8, 1995 WATER TABLE ELEVATIONS
STEWART AIR NATIONAL GUARD BASE
NEWBURGH, NEW YORK

Well Pair	Completion Interval	Elevation Head (Z) (ft msl)	Total Head (ft msl)	Pressure Head (P) (ft)	Calculated Water Table Elevation (ft msl)
MW-05	BR	317.40	349.17	31.77	348.08
MW-06	OB	340.40	348.35	7.95	
MW-07	BR	332.85	355.00	22.15	352.72
MW-08	OB	345.60	353.54	7.94	
MW-09	BR	346.20	357.64	11.44	366.26
MW-10	OB	359.70	363.44	3.74	
MW-11	BR	360.70	371.95	11.25	389.39
MW-12	OB	379.70	383.50	3.80	
MW-04	BR	380.70	405.89	25.19	411.79
JTB-100(b)	OB	390.40	407.73	17.33	
JTB-103(a)	BR	382.30	414.75	32.45	406.21
JTB-103(b)	OB	391.70	411.39	19.69	
JTB-106(a)	BR	360.00	374.38	14.38	375.10
JTB-106(b)	OB	369.00	374.81	5.81	
JTB-107(a)	BR	347.80	361.14	13.34	361.18
JTB-107(b)	OB	358.20	361.17	2.97	
JTB-109(a)	BR	353.30	369.76	16.46	370.68
JTB-109(b)	OB	362.90	370.27	7.37	

Notes:

Calculated water table elevation is based on the following equation:

$$H_{wt} = Z_s - [((Z_s - Z_d) / (P_s - P_d))] \times P_s$$

Where: H_{wt} - Calculated Water Table Elevation
 $Z_{s,d}$ - Elevation Head in the shallow or deep well
 $P_{s,d}$ - Elevation Head in the shallow or deep well

Key:

BR - Bedrock ft - feet
OB - Overburden msl - mean sea level

Notes: ¹ By convention a positive gradient indicates a vertically upward gradient, and a negative gradient indicates vertically downward gradient.

² - Water level in JTB-100a does not appear to be representative of formation conditions, therefore the gradient calculation was based on nearby MW-04.

ft - feet

msl - mean sea level

Hydraulic Conductivity: 1.02E-01 ft/day
3.60E-05 cm/sec
Y-Intercept (Yo): 2.03E+00 ft
Well Screen Ratio (Le/rw): 30.3
Dimensionless Parameter A: 0.00
Dimensionless Parameter B: 0.00
Slope of Line $[\ln(Y_o/Y_t)/t]$: 2.820E-02 1/min
Well Parameters $(Rc^2 / 2*Le)$: 6.889E-04 ft
Dimensionless Ratio $[\ln(Re/rw)]$: 3.648
Effective Radius $[Re]$: 6.33 ft
Volume Tested $[rw < Vol < Re]$: 6.30E+02 ft³

Well/Aquifer Parameters

Depth of well: 34.36 ft
Length of well screen: 5.00 ft
Saturated thickness: 22.00 ft
Diameter of the well casing: 0.166 ft
Diameter of the well filter: 0.330 ft

Results

Hydraulic Conductivity: 1.78E+00 ft/day
 6.29E-04 cm/sec
 Y-Intercept (Yo): 1.97E+00 ft
 Well Screen Ratio (Le/rw): 30.3
 Dimensionless Parameter A: 2.51
 Dimensionless Parameter B: 0.37
 Slope of Line $[\ln(Y_o/Y_t)/t]$: 6.699E-01 1/min
 Well Parameters $(Rc^2 / 2*Le)$: 6.972E-04 ft
 Dimensionless Ratio $[\ln(Re/rw)]$: 2.652
 Effective Radius [Re]: 2.34 ft
 Volume Tested $[rw < Vol < Re]$: 8.56E+01 ft³

Well/Aquifer Parameters

Depth of well: 14.20 ft
 Length of well screen: 5.00 ft
 Saturated thickness: 22.00 ft
 Diameter of the well casing: 0.167 ft
 Diameter of the well filter: 0.330 ft

Results

Hydraulic Conductivity: 6.45E-02 ft/day
2.27E-05 cm/sec
Y-Intercept (Yo): 1.86E+00 ft
Well Screen Ratio (Le/rw): 14.6
Dimensionless Parameter A: 1.99
Dimensionless Parameter B: 0.30
Slope of Line $[\ln(Y_o/Y_t)/t]$: 3.676E-02 1/min
Well Parameters $(R_c^2 / 2*Le)$: 6.972E-04 ft
Dimensionless Ratio $[\ln(R_e/rw)]$: 1.747
Effective Radius $[R_e]$: 1.97 ft
Volume Tested $[rw < Vol < R_e]$: 5.92E+01 ft³

Well/Aquifer Parameters

Depth of well: 6.73 ft
Length of well screen: 5.00 ft
Saturated thickness: 14.73 ft
Diameter of the well casing: 0.167 ft
Diameter of the well filter: 0.687 ft

Re: Electromagnetic Survey, Stewart Air National Guard Base,
Newburgh, New York

Dear Mr. Plumb:

Geophysics GPR International, Inc., under a directive of Aneptek, Inc., performed a electromagnetic (EM31) survey on September 7, 1995, near a fuel pump island on Base Road B, Stewart Air National Guard Base, Newburgh, New York. The objective of the survey was to locate a burial pit reported to contain steel "H" beams.

The EM31 method was chosen, based upon the reported shallow depth of burial of the beams (about ten feet) and proximity of a metal chainlink fence and a buried electrical utility. All electromagnetic and magnetic methods are influenced by surface and near-surface metallic objects and electrical sources with the EM31 meter to a lesser degree.

Additionally, at our own decision and expense, a GSSI SIR-3 radar system with 100-Mhz and 500-Mhz antennas and a Fisher TW-6 pipe and cable locator were mobilized to aid in the investigation.

Theory

The terrain conductivity method employs transmitting and receiving coils separated by a fixed distance. An alternating current is sent through the transmitting coil generating a primary magnetic field. This time-varying magnetic field induces the flow of small secondary currents in the earth, which in turn generate a secondary magnetic field.

Both the primary and secondary magnetic fields are detected by the receiving coil. Within certain limits, the component of the secondary magnetic field, which is out-of-phase (quadrature) with the primary field, is directly proportional to the apparent conductivity of the ground. The component of the secondary field, which is in-phase with the primary field, is related to the magnetic susceptibility and conductivity of the ground, often yielding anomalies near metallic objects. Thus, the terrain conductivity survey provides two readings at each station: the quadrature and the in-phase components of the secondary magnetic field.

Equipment

Geophysics GPR International, Inc. mobilized a geophysicist for this investigation. A Geonics EM-31 Terrain Conductivity Meter was employed for the EM survey. The readings were stored in an Omnidata digital data logger and transferred to a laptop computer. The EM-31 has an intercoil spacing of 12 feet, yielding an effective depth of penetration of about 18 feet.

The radar data were displayed and printed on a graphic recorder, and the fisher readings were observed.

Procedure and Interpretation

Aneptek established a general grid within which the terrain conductivity survey was conducted (see Att). Stations were marked every 50 feet within the site. We established closer-spaced control within this grid so that data collection lines could be run at a 5-foot spacing in a general east-west and north-south directions in order to have the receiver boom location at right angles to each other for the data collection.

Additionally, ground penetrating radar data were collected along lines chosen to cross the conjectured location of the pit containing the discarded H beams. To identify the possible pit and H beams, the geophysicist scanned the GPR display as the assistant pulled the antenna along the chosen traverses. Also, a Fisher TW-6 metal detector was used to test several areas for the presence of the buried H beams.

Results

1. Terrain Conductivity Surveys

The processed EM data are presented as two 11"x 17" color contour maps (see Att). The color plots allow rapid visual assimilation of the geophysical information. The contour maps show the variation of one parameter across the site: the EM-31 in-phase component of the induced magnetic field. One map is a display of the east-west readings and the other map is a display of the north-south readings. The out-of-phase component did not provide a useful response and is not shown.

Interpretation of the terrain conductivity data involved trying to identify the geophysical responses. The prominent geophysical responses at this site are clearly due to the chainlink fence at the northern edge and the buried electrical utility along the westerly edge of the investigated area.

The following comments can be made:

- The steel fence and the buried electrical utility strongly interfered with the EM response of the site along the northern and western edges of the surveyed area
- The pit reported to contain buried H beams was not located within the investigated area. There is a small anomaly centered about position 125N/30E on both plots, but this feature is too small to state with any degree of confidence that it may represent large buried metallic objects
- It is possible that if the H beam-containing pit is located within the areas of fence and cable interference, its anomalous response is masked. However, based upon our experience a large concentration of buried ferrous objects, such as lengths of H beams, should still be observable to a distinct degree through the surficial interference.
- The remainder of the area investigated by EM31 shows normal background readings

2. Ground Penetrating Radar Survey

The quality of the radar data was poor with the depth of penetration less than six feet. The site soil materials, together with the shallow water table, precluded quality records and good penetration.

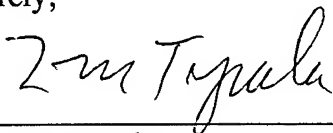

- The GPR method appears to be restricted in its use at this particular area due to subsite conditions.

3. Pipe and Cable Locator Survey

- The Locator gave ambiguous readings within the suspected area, probably due to the depth of burial of the H beams about at the limit of detection by this method.

Geophysics GPR International is pleased to have performed this geophysical service and welcomes the opportunity to work again with your firm.

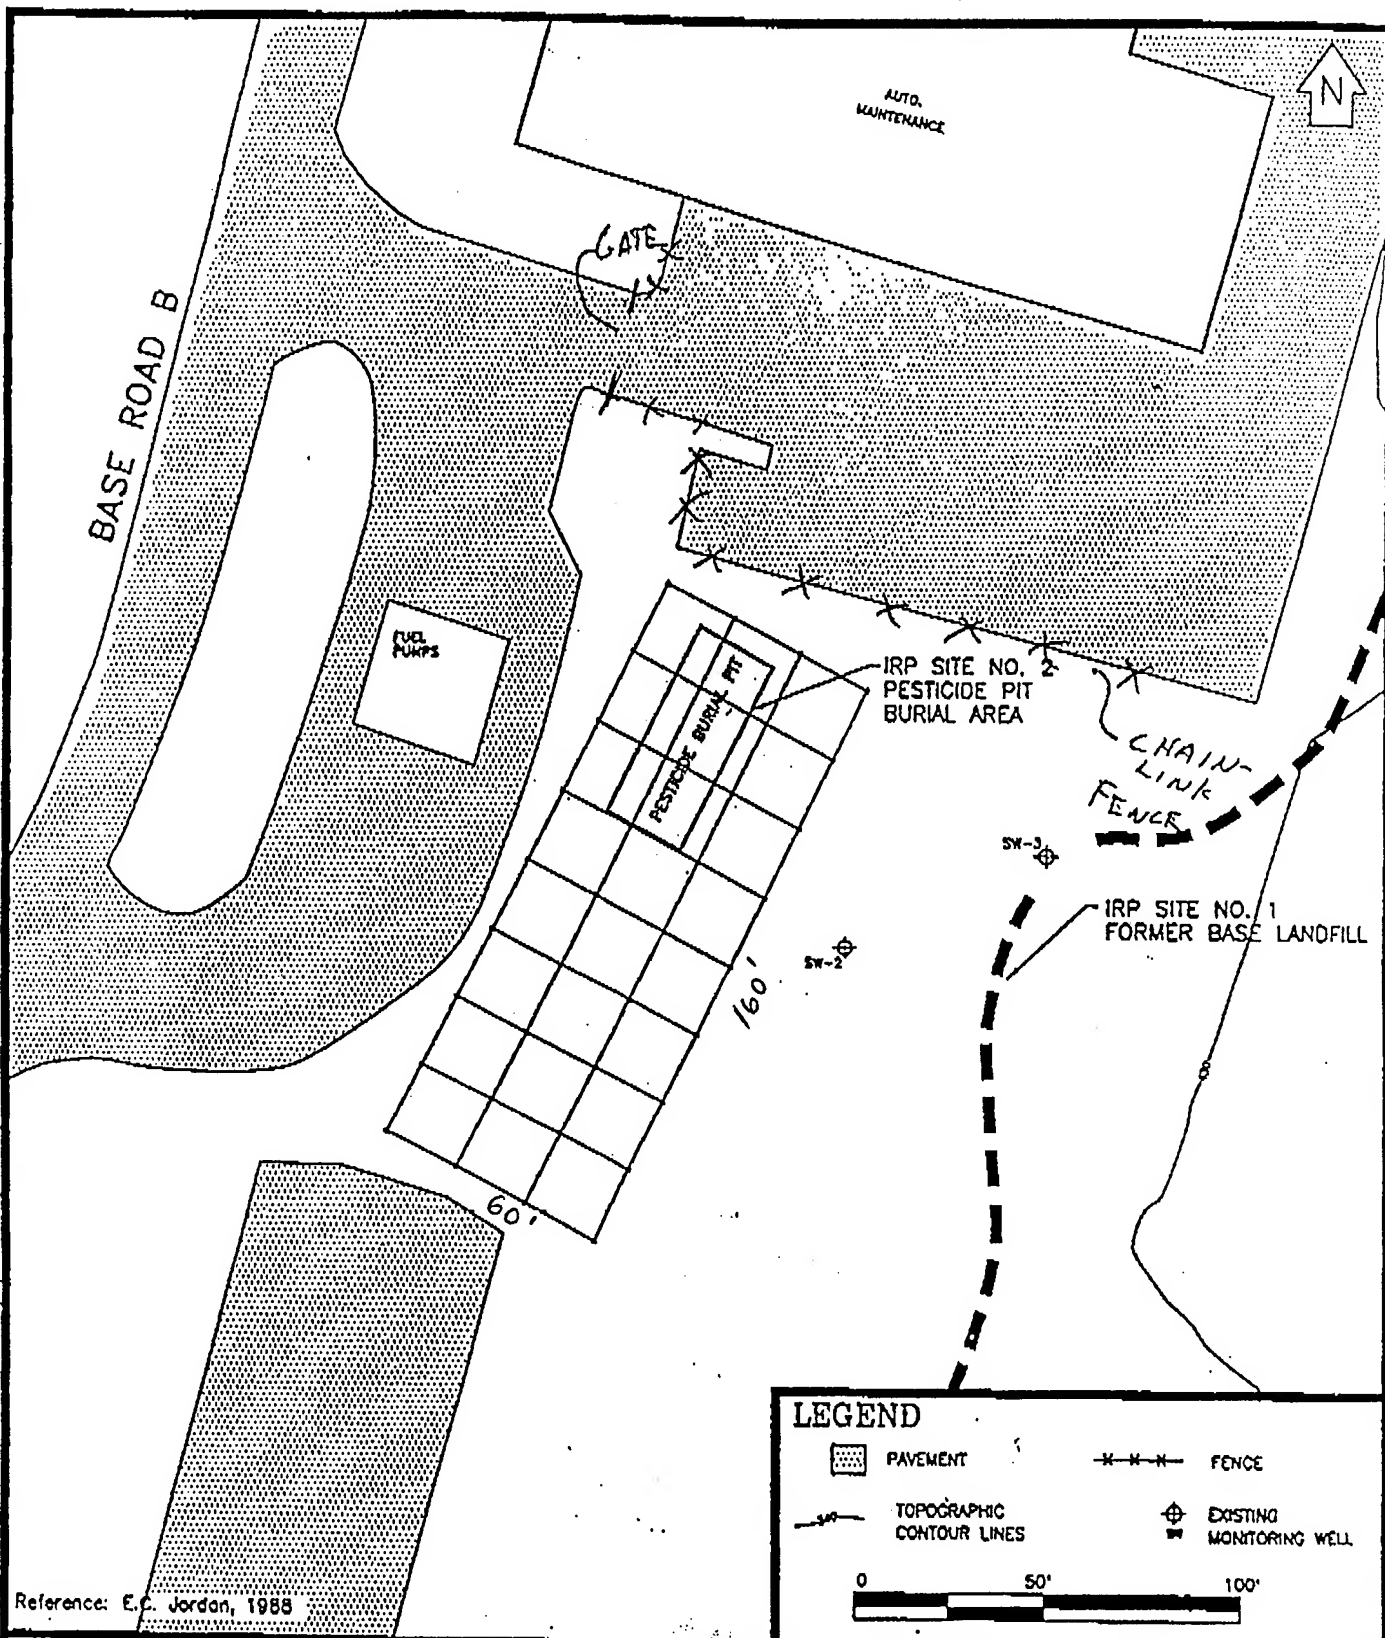

Sincerely,

Lester M. Tyrula,
District Manager

APPENDIX I
PESTICIDE SCREENING DATA

APPENDIX I

I.0 Immuno Assay Screening

I.1 Introduction

Pesticide immuno assay screening of all subsurface soils was performed during the RI to provide an indication of the relative pesticide concentrations in the soils and to aid in the selection of samples to be submitted to the off-site laboratory for chemical analysis. The immuno assay screening test kit used for the Site 2 RI is designed by Millipore Corporation to detect DDT in soils. The principal of the immuno assay screening is based on the use of antibodies produced by living organisms that bind to specific foreign substances or antigens introduced to the organism's body. These antibodies have a strong affinity to bind on to the specific antigen for which they were produced and can be extracted from an organism for use in the screening tests.

I.2 Test Procedure

To perform the test, the potentially contaminated soil sample is placed in a jar and mixed with a solvent to extract any contaminants present on soil particles. This extract is then placed into a test tube coated with a precise quantity of the appropriate antibody for the contaminant of interest. After addition of the sample extract to the test tube, any contaminant available in the extract solution will bind onto the available antibody binding sites along the test tube wall. An enzyme conjugate is then added which is made up of an enzyme that has been linked to the target analyte for which the test was designed. The enzyme does not interfere with the capability of the analyte to bind to the antibody binding sites. In accordance with the law of mass action, the more contaminant present in the sample, the fewer antibody binding sites will be taken up by the enzyme conjugate.

Next, the liquid is emptied out of the test tube to separate the unbound enzyme conjugate from that which is bound to the antibody binding sites along the test tube wall. Then a substrate is added to the test tube which reacts with the enzyme in the enzyme conjugate to produce a color in the liquid. The more conjugate which remains bound to the sides of the test tube, the more intense the color will be. Inversely, the more contaminant present in the extract, the less conjugate will be taken up at the binding sites, and a less intense color is produced. The resistance to the passage of light, or optical density, of the colored liquid is then measured using a differential photometer. The concentration of contaminant present in the original sample can then be approximated based on the optical density.

I.3 Calibration Procedure

The photometer is calibrated from blank and control samples of known concentrations. To calibrate the test, "blank" solution and control samples with known concentrations of DDT in soils of 0.2 ppm, 1.0 ppm, and 10.0 ppm, are provided with the DDT test kit. Interpretation of the

results each test involves obtaining the optical density of the blank sample and each control sample. The optical density of each control sample is then divided by that of the blank sample to obtain the %B₀ for each known concentration. Next, a plot of concentration versus %B₀ is generated, providing a calibration curve for samples analyzed as part of that sample batch. Due to changing characteristics of the calibration curve within varying concentration ranges, it is not valid to attempt to determine contaminant concentrations outside of the control limits of the test kit (i.e., 0.2 ppm and 10.0 ppm). Therefore, should analysis of a sample produce a %B₀ which falls below that of the 10.0 ppm control sample, the concentration can only be reported as being greater than 10.0 ppm. Similarly, when the %B₀ of the sample is found to be higher than that of the 0.2 ppm control sample, the concentration must be reported as being less than 0.2 ppm.

Although the test kit used during the Site 2 RI was developed specifically for DDT, the antibodies present in the kit bind not only to DDT, but also to DDT's metabolites and other structurally similar compounds. For this reason, the results of this screening technology provide concentrations of total pesticides in the soil sample analyzed. Therefore, a direct correlation of concentrations detected during onsite screening and laboratory analysis for TCL Pesticides and PCBs would not be expected as the TCL does not include all compounds to which the screening technology is sensitive. Compounds which provide positive results from the DDT soil screening technology used at Site 2 are listed in Table I-1.

I.4 Evaluation of Calibration Procedures Performed During the Site 2 RI

The results of all screening performed as part of the Site 2 RI are presented in Table 6-12 (see Section 6.2.2). A total of 72 soil samples from 12 soil borings were screened on-site using the immuno assay screening method. Samples were analyzed in 12 batches on 12 different days during the field program. Each day screening was performed, a new calibration curve was developed as described in Section 5.0 of this report. All calibration curves are presented in this Appendix following this discussion.

As noted in Section 6.2.2, Table 6-12, most of the %B₀ values obtained from the analysis of the first four sample batches (analyzed from 10/2/95 through 10/6/95) are greater than 100%, which would suggest that the samples analyzed are actually less contaminated than the "blank" solution. When this problem was observed, Aneptek consulted with Millipore Corporation's technical consultants to identify and solve the problem. Initially, an effort was made to re-analyze a batch of samples to compare results for possible procedural error. Upon re-analysis of the samples collected from soil boring SB-02, the results were comparable to the original data set, providing the same total pesticide concentrations as the first analysis. Aneptek then sent split samples from soil borings SB-03 and SB-04, as well as samples of the "blank" solution and control samples provided with the kit to Millipore for confirmation analysis by their personnel. Results of the confirmation analysis indicated that the "blank" solution provided with the kits was contaminated, producing an optical density lower than that of the samples being analyzed. However, because field screening results were evaluated in relation to the %B₀ of both the sample and the control samples, the effect of the contaminated "blank" solution was negated. Therefore, while the %B₀

values for the initial sample batches appear too high, the sample total pesticide concentrations are still valid.

Zinc	PM	1.3	13.3	20
Cyanide	C	10	10 U	10

J, UJ - QUANTITATION IS APPROXIMATE DUE TO LIMITATIONS IDENTIFIED IN THE
 QUALITY CONTROL REVIEW (DATA REVIEW).
 R - VALUE IS REJECTED.
 U - VALUE IS NON-DETECTED AT INSTRUMENT DETECTION LIMIT

ANALYTICAL METHOD
 F - FURNACE
 P - ICP/FLAME AA
 CV - COLD VAPOR
 M - MICROWAVE DIGESTION
 CA - MIDI-DISTILLATION
 AV - AUTOMATED COLD VAPOR AA

CLP DATA ASSESSMENT

Functional Guidelines for Evaluating Organic Analysis

Case No. 154139 SDG No. AC139 Laboratory Envirotest Lab. Site Stewart ANG

Data Assessment:

The SDG AC139/154139 contains the following samples for analysis:

Volatiles: 10 soil/ SB-02-02, SB-02-06, SB-02-10.2, SB-04-02, SB-04-21,
SB-04-06, SB-03-06, SB-03-56, SB-03-22, SB-03-1.3
2/aqueous/RB-SB-100595, TB-03

Semi-volatiles: 10 soil/ SB-02-02, SB-02-06, SB-02-10.2, SB-04-02, SB-04-21,
SB-04-06, SB-03-06, SB-03-56, SB-03-22, SB-03-1.3
1/aqueous/RB-SB-100595

Pesticides/PCBs: 10 soil/ SB-02-02, SB-02-06, SB-02-10.2, SB-04-02, SB-04-21,
SB-04-06, SB-03-06, SB-03-56, SB-03-22, SB-03-1.3
1/aqueous/RB-SB-100595

Associated QC: SB-03-06, SB-03-56/Field duplicates

The current Functional Guidelines for evaluating organic data have been applied.

All data are valid and acceptable except those analytes which have been qualified with a "J" (estimated), "N" (presumptive evidence for the presence of the material), "U" (non-detects), "R" (unusable), or "JN" (presumptive evidence for the presence of the material at an estimated value). All action detailed on the attached sheets. Spreadsheets containing the validated sample results are found at the end of the report.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant QC problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Reviewer's signature: GC/MS by Sam for Elissa McDonagh Date: 01/29/96

Reviewer's signature: Pest/PCB by Lori MacKinnon Date: 01/29/96

Verified By: Lorie MacKinnon Date: 01/29/96

DATA ASSESSMENT

1. HOLDING TIME:

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detects (sample quantitation limits) will be flagged as estimated, "UJ", or "R", if the holding times are grossly exceeded.

The following analytes in the samples shown were qualified because of holding time: All samples were extracted and analyzed within the required holding times.

DATA ASSESSMENT

2. BLANK CONTAMINATION:

Quality assurance (QA) blanks, i.e., method, trip, field, or rinse blanks are prepared to identify any contamination which may have been introduced into the samples during the sample preparation or field activity. Method blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. If the concentration of the analyte is less than five times the blank contaminant level (ten times for the common contaminants), the analytes are qualified as non-detects, "U". The following analytes in the samples shown were qualified with "U" for these reasons:

Blank Actions

- Value < CRQL; report CRQL followed by "U" (U5).
- Value > CRQL and < action level; report value followed by "U" (U6).
- Value > CRQL and > action level; report value unqualified.

A. Method blank contamination:

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Methylene Chloride	2 ug/kg	20 ug/kg
Acetone	15 ug/kg	150 ug/kg
di-n-butyl phthalate	130 ug/kg	1300 ug/kg
Heptachlor	0.22 ug/kg	1.1 ug/kg

The action level values were compared to the sample values and the following recommendations are recommended: Methylene chloride in samples SB-04-06, SB-03-06, SB-03-56, SB-03-22, SB-03-22RE, SB-03-1.3, SB-02-10.2, SB-02-10.2RE, SB-04-02, SB-04-21 and SB-04-21RE, Acetone in samples SB-04-06, SB-03-56, SB-02-02, SB-02-06 and SB-04-02, di-n-butyl phthalate in samples SB-04-21, SB-03-22 and SB-03-1.3 and Heptachlor in samples SB-02-10.2, SB-04-02, SB-04-21, SB-04-06, SB-03-06, SB-03-56, SB-03-22 and SB-03-1.3 are reported as the CRQL followed by a "U5". Acetone in samples SB-03-06, SB-03-22, SB-03-22RE, SB-03-1.3, SB-02-10.2, SB-02-10.2RE, SB-04-21 and SB-04-21RE should be reported as the value followed by "U6", (i.e., the CRQL has been raised and the value is considered to be non-detect).

It should be noted that Pesticide/PCB fraction method blank PBLK03, associated with all SDG aqueous samples, had a positive result for Heptachlor (0.006 ug/L). Qualification was not required as the aqueous samples were field rinse blanks and are not blank qualified.

B. Field or rinse blank contamination ("water blanks" or "distilled water blanks " are validated like any other sample):

Rinse blank RB-SB-100595 Associated samples: All soil samples in SDG

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Methylene Chloride	1 ug/L	10 ug/L
Acetone	5 ug/L	50 ug/L
bis(2-ethylhexyl)- phthalate	3 ug/L	30 ug/L

The action level values were compared to the sample values and the following recommendations are recommended: Bis(2-ethylhexyl)phthalate in samples SB-02-02, SB-04-02, SB-04-21, SB-04-06, SB-03-06, SB-03-56 and SB-03-1.3 should be reported as the CRQL followed by a "U5".

C. Trip blank contamination:

Trip Blank TB-03

Associated samples: All soils in the SDG

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Methylene Chloride	1 ug/L	10 ug/L
Acetone	3 ug/L	30 ug/L

The action level values were compared to the sample values and the following recommendations are recommended: All compound results were previously blank qualified due to laboratory or field blanks.

DATA ASSESSMENT

3. MASS SPECTROMETER TUNING:

Tuning performance criteria are established to ensure adequate mass resolution, proper identification of compounds, and to some degree, sufficient instrument sensitivity. These criteria are not sample specific. Instrument performance is determined using standard materials. Therefore, these criteria should be met in all circumstances. The tuning standard for volatile organics is bromofluorobenzene (BFB) and for semi-volatiles is decafluorotriphenyl-phosphine (DFTPP).

If the mass calibration is in error, or missing, all associated data will be classified as unusable, "R". The following samples shown were qualified with "R" because of tuning: All tuning criteria were met.

DATA ASSESSMENT

4. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of giving acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument is giving satisfactory daily performance.

A. RESPONSE FACTOR

The response factor measures the instrument's response to specific chemical compounds. The response factor for the VOA/ABN Target Compound List (TCL) must be ≥ 0.05 in both the initial and continuing calibrations. A value < 0.05 indicates a serious detection and quantitation problem (poor sensitivity). If the mean RRF of the initial calibration or the continuing calibration has a response factor < 0.05 for any analyte, those analytes detected in environmental samples will be qualified as estimated, "J". All nondetects for those compounds will be rejected, "R". The following analytes in the samples shown were qualified because of response factor:

ABN instrument "5972-1", initial calibration 10/04/95:

<u>COMPOUND</u>	<u>IC</u> <u>(10/4/95)</u>	<u>CC</u> <u>(10/18/95)</u>
-----------------	-------------------------------	--------------------------------

4-Nitrophenol

+

Associated samples: All listed RBSB100595
SB-03-1.3

+ - RF < 0.05 ; Estimate positive results (J2) and reject non-detects (R2) in the associated samples.

DATA ASSESSMENT

5. CALIBRATION

A. PERCENT RELATIVE STANDARD DEVIATION (%RSD) AND PERCENT DIFFERENCE (%D):

Percent RSD is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent D compares the response factor of the continuing calibration check to the mean response factor (RRF) from the initial calibration. Percent D is a measure of the instrument's daily performance. Percent RSD must be < 30% and the %D must be < 25%. A value outside of these limits indicates potential detection and quantitation errors. For these reasons, all positive results are flagged as estimated, "J"; and non-detects are flagged "UJ". If the %RSD and %D grossly exceed QC criteria, non-detect data may be qualified "R".

For the PCB/PESTICIDE fraction, if %RSD exceeds 20% for all analytes except to the two surrogates (which must not exceed 30% RSD), qualify all associated positive results "J" and non-detects "UJ". If the %RPD of the continuing calibration check is greater than 25%, positive and non-detected results are estimated "J, UJ".

The following analytes in the samples shown were qualified for %RSD, %D or %RPD:

VOA instrument "MSD", initial calibration 09/18/95:

<u>COMPOUND</u>	<u>IC</u> <u>(9/18/95)</u>	<u>CC</u> <u>(10/11/95)</u>	<u>CC</u> <u>(10/12/95)</u>	<u>CC</u> <u>(10/13/95)</u>
Vinyl Chloride		X		
Chloroethane		X		
Acetone				X
Carbon disulfide		X	X	X
Associated samples:	All listed	SB-02-02 SB-02-06 SB-02-10.2	SB-04-02 SB-04-21 SB-04-06 SB-03-06 SB-03-56 SB-03-22 TB-03, SB-03-1.3 RBSB100595 SB-02-10.2RE	SB-04-21RE SB-03-22RE

ABN instrument "5972-1", initial calibration 10/04/95:

<u>COMPOUND</u>	<u>IC</u> <u>(10/4/95)</u>	<u>CC</u> <u>(10/18/95)</u>	<u>CC</u> <u>(10/19/95)</u>
Hexachlorocyclopentadiene			X
3-Nitroaniline	X		X
2,4-Dinitrophenol	X	X	
4-Nitrophenol			X
Pentachlorophenol	X		X
Associated samples:	All listed	RBSB100595 SB-03-1.3	SB-02-02, SB-02-06 SB-02-10.2, SB-04-02 SB-04-21, SB-04-06 SB-03-06, SB-03-56 SB-03-22

X - %RSD > 30% or %D > 25%; Estimate (J4) positive and non-detected (UJ4) results in the associated samples.

DATA ASSESSMENT

6. SURROGATES/SYSTEM MONITORING COMPOUNDS (SMC):

All samples are spiked with surrogate/SMC compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. If the measured surrogate/SMC concentrations were outside contract specifications, qualifications were applied to the samples and analytes as shown below. The following analytes for the samples shown were qualified because of surrogate/SMC recovery: All surrogate recoveries were within validation guidelines.

DATA ASSESSMENT

7. INTERNAL STANDARDS PERFORMANCE:

Internal Standard (IS) performance criteria ensure that the GC/MS sensitivity and response are stable during every experimental run. The internal standard area count must not vary by more than a factor of two (-50% to +100%) from the associated continuing calibration standard. The retention time of the internal standard must not vary by more than +/-30 seconds from the associated continuing calibration standard. If the area count is outside the (-50% to +100%) range of the associated standard, all of the positive results for compounds quantitated using that IS are qualified as estimated "J", and all non-detects as "UJ" only if IS area is <50%. Non-detects are qualified as "R" if there is a severe loss of sensitivity (<25% of the associated area counts).

If an internal standard retention time varies by more than 30 seconds, the reviewer will use professional judgment to determine either partial or total rejection of the data for that sample fraction. The following analytes in the samples shown were qualified because of internal standards performance:

The VOA internal standard 1,4-Difluorobenzene was under-recovered in the soil sample SB-03-22RE. The VOA internal standard Chlorobenzene-d5 was under-recovered in the soil samples SB-02-10.2, SB-04-21, SB-03-22, SB-02-10.2RE, SB-04-21RE and SB-03-22RE. It is recommended to estimate the positive results (J15) and non-detects (UJ15) for all compounds quantitated from the internal standards in the associated samples.

DATA ASSESSMENT

8. COMPOUND IDENTIFICATION:

A. VOLATILE AND SEMI-VOLATILE FRACTIONS

TCL compounds are identified on the GC/MS by using the analyte's relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within +/- 0.06 RRT units of the standard compound, and have an ion spectra which has a ratio of the primary and secondary m/e intensities within 20% of that in the standard compound. For tentatively identified compounds (TIC), the ion spectra must match accurately. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications. The following analytes in the samples shown were qualified for compound identification:

B. PESTICIDE FRACTIONS

The retention times of reported compounds must fall within the calculated retention time windows for the two chromatographic columns. The percent difference (%D) of the positive results obtained on the two GC columns should be <= 25%. The following analytes in the samples shown were qualified because of compound identification:

It should be noted that Heptachlor had a %D >25% in most samples. However, as the compound was blank qualified "U" in all samples, there is no estimation.

SB-02-02 - 4,4'-DDD (40.0%, J25)

SB-02-06 - 4,4'-DDE (82.6%, JN25), 4,4'-DDD (118.2%, R25) and 4,4'-DDT (41.7%, J25)

SB-02-10.2- 4,4'-DDD (133.3%, R25)

SB-04-02 - 4,4'-DDD (62.3%, JN25) and Dieldrin (42.2%, J25). The higher results for 4,4'-DDE (5.1 ug/kg) and Dieldrin (9.1 ug/kg) quantitated from column DB-17 were more acceptable as the two compounds were resolved on the second column and integration performed for the DB-5 column was poorly done. The compounds were not fully resolved and a perpendicular should have been dropped to the baseline. The results were substituted by the validator.

SB-03-56- 4,4'-DDE (78.0%, JN25)

SB-03-1.3- 4,4'-DDD (120.0%, R25)

DATA ASSESSMENT

9. MATRIX SPIKE/SPIKE DUPLICATE, MS/MSD:

The MS/MSD data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD may be used in conjunction with other QC criteria for some additional qualification of data. The following analytes, for the samples shown, were qualified because of the MS/MSD:

It should be noted that the ABN fraction aqueous matrix spike blank compounds 4-Nitrophenol and Pentachlorophenol were slightly over-recovered. The ABN fraction soil matrix spike blank compound Pentachlorophenol was slightly over-recovered. No action is recommended.

DATA ASSESSMENT

10. OTHER QC DATA OUT OF SPECIFICATION:

VOLATILES: It should be noted that the laboratory reference spectra for Acetone was of poor quality. The m/z ion 58 was used to quantitate acetone (the SOP requests the 43 ion to be used for quantitation). The m/z ion 91 was used to quantitate xylenes (the SOP requests the 106 ion to be used for quantitation).

The Tentatively Identified Compound forms (1B) did not include the "JN" qualifier.

The response factors are not shown on the quantitation reports.

11. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT: Overall system performance was good.

12. CONTRACTUAL NON-COMPLIANCE: None

13. This package contains re-extraction, re-analysis or dilution. Upon reviewing the QC results, the following form I(s) and/or compounds are identified to be used:

Volatiles:

SB-02-10.2, SB-01-10.2RE

Use the non-detected results for Vinyl chloride and Chloroethane from the re-analysis.

Use all other positive and non-detected results from the original analysis.

SB-04-21, SB-04-21RE

Use positive and non-detected results from the original analysis.

SB-03-22, SB-03-22

Use positive and non-detected results from the original analysis.

The current Functional Guidelines for evaluating inorganic data have been applied.

2.1 Validation Flags

The following flags have been applied in red by the data validator and must be considered by the data user.

J, UJ - This flag indicates the result qualified as estimated.

R - This flag indicates an unusable value. The rejected data are known to contain significant errors based on documented information and must not be used by the data user.

Usable - The results that do not carry "J" or "R" are fully usable.
Data

2.2 The Data Assessment

The inorganic data were evaluated based on the following parameters:

- * . Data Completeness
- * . Holding times
- . Calibration verification results

- . Blank analysis
- * . Interference check standard results
- . Matrix spike results
- . Duplicate analysis results
- * . Field duplicate analysis
- * . Laboratory control sample results
- . Furnace AA results
- . ICP serial dilution results
- . Detection limit results
- * . Calculation and transcription checks

* - all criteria were met for this parameter.

Validation actions were taken based on the following information:

Calibration Verification

The 2xCRDL standard for Chromium was under-recovered at 64.6%. Results near the CRDL may be biased low. Estimate positive and non-detected (J2, UJ2) Chromium results which are less than 4xCRDL of 8 mg/kg or 40 ug/L. Based on this action level, Chromium results for samples RB-SB-100595 and SB0406 are estimated.

The CRA standard for Lead was over-recovered at 122%. Results near the CRDL may be biased high. Estimate (J2) positive Lead results which are less than 2xCRDL of 1.2 mg/kg or 6 ug/L. Based on this action level, the Lead result for SB0210 would be estimated. However, as the sample lead result was rejected due to matrix spike recovery, there is no action.

It should be noted that the low standard of 5 ug/L was used for the Lead analysis, instead of the CRDL of 3 ug/L. As all lead results were rejected due to matrix spike recovery, there is no action.

Matrix Spike Recoveries

Antimony (47.5%), Lead (324.9%) and Thallium (72.4%) were recovered outside of the control limits in the matrix spike performed on sample SB-04-06. Due to a possible low bias, all Antimony and Thallium results are estimated (J5, UJ5). As the Lead recovery was greater than 200%, all detected Lead results are rejected (R5).

It should be noted that the validator did not apply the matrix spike actions to the aqueous sample.

Laboratory Duplicates

The Lead duplicate precision (147%) was not within control limits for the laboratory duplicate performed on sample SB-04-06. All Lead results would be estimated (J6), however, as they were previously rejected due to matrix spike recovery, there is no action taken.

Blanks

Lead was detected in the laboratory calibration blank CCB4 at the negative CRDL. Therefore, results less than 10XCRDL are rejected (R3). The five samples on either side of CCB4 were reviewed and the following actions are taken: Lead is rejected for sample RB-SB-100595.

The field blank contained levels of several metals above the CRDL. The following table lists the maximum concentration of each metal found in the blanks along with the resultant action level.

Field Blank RB-SB-100595 associated with all SDG samples

<u>Element</u>	<u>Maximum Conc./Units</u>	<u>Action Level</u>
Calcium	30500 ug/L, 6100 mg/kg	30500 mg/kg
Iron	279 ug/L, 55.8 mg/kg	279 mg/kg
Sodium	30100 ug/L, 6020 mg/kg	30100 mg/kg
Zinc	36.3 ug/L, 7.26 mg/kg	36.3 mg/kg

Value < Action Level; the value is rejected R3.

Value > IDL and > Action Level; the value is reported unqualified.

The action level values were compared to the sample value before application of sample dilution factors. Based on the action levels found, the following actions are taken: Calcium results for samples SB-02-02, SB-02-06, SB-0210, SB-04-02, SB-04-21, SB-04-06, SB-03-06, SB-03-56 and SB-03-1.3 (SB0213) are rejected (R3). Sodium results for samples SB-02-02, SB-02-06, SB-0210, SB-04-02, SB-04-21, SB-04-06, SB-03-06, SB-03-56, SB-03-22 and SB-03-1.3 (SB0213) are rejected (R3).

Furnace AA Results

Furnace AA QC data were reviewed. Duplicate injections and one-point analytical spikes were performed for each sample and analyte. All duplicate injections agreed within +/- 20%. Spike recoveries met the 85 - 115% recovery criteria for all samples with the following exception:

<u>Analyte</u>	<u>Sample ID</u>	<u>Recovery</u>	<u>Action</u>
Lead	RBSB100595	115.9%	No action, result U
Arsenic	SB0406	116.0%	No action, result U
Thallium	SB0206	83.7%	J10, UJ10
Thallium	SB0210	122.0%	No action, result U

ICP Serial Dilution

A serial dilution was performed on sample SB-04-06. For initial concentrations greater than 10XIDL, the following %Ds were greater than 10% : Barium (11.7%), Copper (11.5%) and Vanadium (23.6%). As 10XIDL was less than the CRDL in all cases, all Barium, Copper and Vanadium results greater than the CRDL are estimated (J12).

It should be noted that the validator did not apply the matrix spike actions to the aqueous sample.

Detection Limit Results

It should be noted that ICP sample SB-04-21 was diluted 2X as Iron exceeded the calibration range. The diluted results for all analytes were reported, thus elevating the instrument detection limit (IDL) for all ICP analytes for sample SB-04-21.

It should be noted that the soil Cyanide IDL of 1.0 mg/kg is greater than the contract required detection limit of 0.50 mg/kg. No action is recommended.

CLP DATA ASSESSMENT

Appendix A.4: CLP Data Assessment Result Forms:

Spreadsheets containing the validated sample results are found at the end of the report.

- 4 - Problems, but do not affect data.

DATA VALIDATION RECOMMENDATION FOOTNOTES - ORGANICS

- J1, UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and non-detects (UJ1). Holding times have been grossly exceeded: reject all non-detects (R1).
- J2, R2 The initial or continuing calibration RF was low: estimate positive results (J2) and reject non-detects (R2).
- J4, UJ4 The initial calibration %RSD was greater than 30% or the continuing calibration %D was greater than 25%: estimate positive results (J4) and non-detects (UJ4).
- U5 Compound was present in the associated blank. Compound is present in the sample at a concentration less than the CRQL: report the CRQL (U5).
- U6 Compound was present in the associated blank. Compound was present in the sample at a concentration higher than the CRQL but lower than the "action level": qualify the result by reporting the value followed by "U" (U6). (i.e., the limit of detection has been raised for that compound, and the result is considered to be non-detect.
- J7 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was greater than the Contract Required Recovery Range (CRR): estimate positive results within that area of the chromatogram (J7).
- J8, UJ8 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was less than the CRR: estimate positive results (J8) and non-detects (UJ8) within that area of the chromatogram.
- J9, R9 One of more of the surrogate standard % recoveries was less than 10%: estimate positive results (J9) and reject non-detects (R9) within that area of the chromatogram.
- J10 The matrix spike (MS) and/or matrix spike duplicate (MSD) % recoveries were not within the CRR for this compound: estimate positive results in the unspiked sample (J10).
- J11, R11 The MS and/or MSD % recoveries were less than 10% for this compound: estimate positive results in the unspiked sample (J11) and reject non-detects (R11).
- J12 The MS/MSD %RPD for this compound was high: estimate positive results in the unspiked sample (J12).
- J13 Field duplicate %RPD was high for this compound: estimate positive results for this compound in the sample and duplicate (J13).

- J14 One or more of the Internal Standard (IS) areas were detected above the CRR; estimate the positive results for all compounds quantitated from that IS.
- J15, UJ15 One or more of the Internal standard (IS) areas were not within the CRR: estimate positive results (J15) and non-detects (UJ15) for all compounds quantitated from that IS.
- J16, R16 One or more IS areas were grossly low: estimate (J16) positive results and reject (R16) non-detects for all compounds quantitated from that IS.
- J/NJ17, R17 % Breakdown for DDT exceeded 20%: estimate positive results for DDT (J17), DDD, and DDE (NJ17) in all associated samples. If no DDT is present, but DDD and/or DDE are present: reject the CRQL (R6) for DDT. Qualify positive results for DDD and/or DDE as presumptively present at an estimated quantity (NJ17).
- J/NJ18, R18 % Breakdown for endrin exceeded 20%: estimate positive results for endrin (J18). If no endrin is present, but endrin ketone and/or endrin aldehyde are present: reject the CRQL (R7) for endrin. Qualify positive results for endrin aldehyde and endrin ketone (NJ18) as presumptively present at an estimated quantity.
- J/UJ19, R19 Initial calibration %RSD for this compound exceeded 20%: estimate positive and non-detected results (J19, UJ19) for this compound in associated samples. If %RSD exceeded 90%, flag all non-detected results as unusable (R8).
- J/UJ20, R20 Continuing calibration %RPD for this compound exceeded 25% (quantitation or confirmation column): estimate positive and non-detected results (J20, UJ20) for this compound in associated samples. If %RPD exceeded 90%, flag all non-detected results as non-usable (R9).
- J21 Compound reported above calibration range, estimate result (J21).
- J22 The continuing calibration %D exceeded 25% for a surrogate standard compound: estimate (J22) positive results for all compounds associated with the out of control surrogate in the affected samples.
- J23 Surrogate %D >25% or %RSD > 30%, estimate positive results for compounds associated with the out of control surrogate.
- R24 The initial calibration %RSD or continuing calibration %D > 90%. Reject non-detects.
- J/NJ25, R25 Pesticide compound which has concentration values differing from 25 - 50% in its two analyses. Compound result is estimated. Dual

column analysis %D is between 50 - 90%; compound result is qualified as presumptively present at an approximated quantity (NJ25). Dual column %D is greater than 90%; the compound result is rejected (R10).

- R26 Reject non-detected result. Compound detected above the calibration range and could not be quantitated to be reported.
- R27 Isomer identified at the incorrect retention time in samples and/or standards. Reject positive and non-detected results.
- R28 Quality of Spectra submitted poor for compound in question: reject compound result.

DATA VALIDATION RECOMMENDATION FOOTNOTES - INORGANICS

- J/UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and reject non-detects (R1). Samples were improperly preserved prior to analysis; estimate positive results (J1) non-detects (UJ1).
- J/UJ2, R2 Linearity was poor near the CRDL (Low levels). Estimate or reject the results within an affected area based on the recovery of the CRDL standard.
- R3 The analyte was present in the associated blank above the CRDL. The sample result was less than the action level of 5X the maximum concentration found in any blank, and has been rejected. The associated blank had a value below the negative CRDL. Results less than ten times the CRDL are rejected.
- J/UJ4, R4 The ICS recovery of an element is outside of criteria. The reported results or detection limits are estimated or rejected based on the recovery of the interference check sample.
- J/UJ5, R5 The recovery of an element is outside of control limits in the matrix spike. The reported results or detection limits are estimated or rejected based on the recovery.
- J/UJ6 The RPD for laboratory duplicate sample analysis results exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ7 The RPD for the field duplicate analysis exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ8, R8 The LCS recovery for an element is outside of criteria. The reported results are estimated or rejected based on the laboratory control sample analyte recovery.
- J9 The %RSD of duplicate injections for GFAA analysis do not agree within +/- 20%, or the laboratory performed a single burn analysis. The sample results are estimated.
- J10, UJ10 The recovery of analytical spikes for GFAA analysis is outside of control limits. Positive sample results or detection limits are estimated.
- J11 The sample required an MSA which was not performed, was performed incorrectly, or the correlation was < 0.995. The positive results are estimated.
- J12, R12 The results of the ICP Serial Dilution analysis were outside of control limits for initial concentrations equal to or greater than 10XIDL. Analyte results greater than 10XIDL or CRDL are estimated

or rejected based on %D.

- J13 The sample was less than 50% solids. Analysis using a method intended for soils might not give representative results. The results are estimated.
- J14, UJ14 Matrix spike not performed for analysis. Estimate results (J14, UJ14) based on lack of accuracy data.
- J15 Laboratory duplicate not performed for analysis. Estimate positive results (J18) greater than the CRDL based on lack of precision data.

CLP DATA ASSESSMENT

Functional Guidelines for Evaluating Organic Analysis

Case No. 154009 SDG No. AC009 Laboratory Envirotest Lab. Site Stewart ANG

Data Assessment:

The SDG AC009/154009 contains the following samples for analysis:

Volatiles: 11 soil/ SB-01-02, SB-01-18.5, SB-01-32.5, SS-01, SS-15, SS-02, SS-03, SS-04, SS-05, SS-06, SS-07
4/aqueous/RW-SS-100395, FB-TW-100395, TRIP BLK01, TB-02

Semi-volatiles: 11 soil/ SB-01-02, SB-01-18.5, SB-01-32.5, SS-01, SS-15, SS-02, SS-03, SS-04, SS-05, SS-06, SS-07
2/aqueous/RW-SS-100395, FB-TW-100395

Pesticides/PCBs: 11 soil/ SB-01-02, SB-01-18.5, SB-01-32.5, SS-01, SS-15, SS-02, SS-03, SS-04, SS-05, SS-06, SS-07
2/aqueous/RW-SS-100395, FB-TW-100395

Associated QC: SS-1, SS-15 Field Duplicates

The current Functional Guidelines for evaluating organic data have been applied.

All data are valid and acceptable except those analytes which have been qualified with a "J" (estimated), "N" (presumptive evidence for the presence of the material), "U" (non-detects), "R" (unusable), or "JN" (presumptive evidence for the presence of the material at an estimated value). All action detailed on the attached sheets.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant QC problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Reviewer's signature: GC/MS by Lisa McDonagh Date: 01/29/96

Reviewer's signature: Pest/PCB by Lorie MacKinnon Date: 01/29/96

Verified By: Lorie MacKinnon Date: 01/29/96

DATA ASSESSMENT

1. HOLDING TIME:

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detects (sample quantitation limits) will be flagged as estimated, "UJ", or "R", if the holding times are grossly exceeded.

The following analytes in the samples shown were qualified because of holding time: All samples were extracted and analyzed within the required holding times.

DATA ASSESSMENT

2. BLANK CONTAMINATION:

Quality assurance (QA) blanks, i.e., method, trip, field, or rinse blanks are prepared to identify any contamination which may have been introduced into the samples during the sample preparation or field activity. Method blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. If the concentration of the analyte is less than five times the blank contaminant level (ten times for the common contaminants), the analytes are qualified as non-detects, "U". The following analytes in the samples shown were qualified with "U" for these reasons:

Blank Actions

- Value < CRQL; report CRQL followed by "U" (U5).
- Value > CRQL and < action level; report value followed by "U" (U6).
- Value > CRQL and > action level; report value unqualified.

A. Method blank contamination:

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Acetone	12 ug/kg	120 ug/kg
Heptachlor	0.26 ug/kg	1.3 ug/kg

The action level values were compared to the sample values and the following recommendations are recommended: Acetone in samples SB-01-02, SB-01-32.5, SS-01, SS-03, SS-05, SS-06 and SS-15 and Heptachlor in samples SS-15, SB-01-18.5, SB-01-32.5, SS-01, SS-02, SS-03, SS-04, SS-06 and SS-07 should be reported as the CRQL followed by a "U5". Acetone in samples SB-01-18.5, SS-02, SS-04 and SS-07 should be reported as the value followed by "U6", (i.e., the CRQL has been raised and the value is considered to be non-detect).

B. Field or rinse blank contamination ("water blanks" or "distilled water blanks" are validated like any other sample):

It should be noted that Field Blank FB-TW-100395 which is a field blank of source water used for drilling, is not used to qualify the samples based on region II validation protocol.

Rinse blank RW-SS-100395

Associated samples: SS-01, SS-02, SS-03, SS-04, SS-05, SS-06, SS-07, SS-15

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Acetone	5 ug/L	50 ug/L
bis(2-ethylhexyl)- phthalate	1 ug/L	10 ug/L

The action level values were compared to the sample values and the following recommendations are recommended: Bis(2-ethylhexyl)phthalate in samples SS-01, SS-02, SS-04 and SS-06 should be reported as the CRQL followed by a "U5".

Rinse blank RB-SB-100595

Associated samples: SB-01-02, SB-01-18.5, SB-01-32.5

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Methylene Chloride	1 ug/L	10 ug/L
Acetone	5 ug/L	50 ug/L
bis(2-ethylhexyl)- phthalate	3 ug/L	30 ug/L

The action level values were compared to the sample values and the following recommendations are recommended: Methylene chloride in sample SB-01-18.5 and Bis(2-ethylhexyl)phthalate in sample SB-01-32.5 should be reported as the CRQL followed by a "U5".

C. Trip blank contamination:

Trip Blank Trip blk01

Associated samples: SB-01-02, SB-01-18.5, SB-01-32.5

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Methylene Chloride	1 ug/L	10 ug/L
Acetone	7 ug/L	70 ug/L

Trip Blank TB-02

Associated samples: SS-01, SS-02, SS-03, SS-04, SS-05, SS-06, SS-07, SS-15

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Acetone	1 ug/L	10 ug/L

The action level values were compared to the sample values and the following recommendations are recommended: All compound results were previously blank qualified due to laboratory or field blanks.

DATA ASSESSMENT

3. MASS SPECTROMETER TUNING:

Tuning performance criteria are established to ensure adequate mass resolution, proper identification of compounds, and to some degree, sufficient instrument sensitivity. These criteria are not sample specific. Instrument performance is determined using standard materials. Therefore, these criteria should be met in all circumstances. The tuning standard for volatile organics is bromofluorobenzene (BFB) and for semi-volatiles is decafluorotriphenyl-phosphine (DFTPP).

If the mass calibration is in error, or missing, all associated data will be classified as unusable, "R". The following samples shown were qualified with "R" because of tuning: All tuning criteria were met.

DATA ASSESSMENT

4. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of giving acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument is giving satisfactory daily performance.

A. RESPONSE FACTOR

The response factor measures the instrument's response to specific chemical compounds. The response factor for the VOA/ABN Target Compound List (TCL) must be ≥ 0.05 in both the initial and continuing calibrations. A value < 0.05 indicates a serious detection and quantitation problem (poor sensitivity). If the mean RRF of the initial calibration or the continuing calibration has a response factor < 0.05 for any analyte, those analytes detected in environmental samples will be qualified as estimated, "J". All nondetects for those compounds will be rejected, "R". The following analytes in the samples shown were qualified because of response factor: All response factors were greater than or equal to 0.05 units.

DATA ASSESSMENT

5. CALIBRATION

A. PERCENT RELATIVE STANDARD DEVIATION (%RSD) AND PERCENT DIFFERENCE (%D):

Percent RSD is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent D compares the response factor of the continuing calibration check to the mean response factor (RRF) from the initial calibration. Percent D is a measure of the instrument's daily performance. Percent RSD must be < 30% and the %D must be < 25%. A value outside of these limits indicates potential detection and quantitation errors. For these reasons, all positive results are flagged as estimated, "J"; and non-detects are flagged "UJ". If the %RSD and %D grossly exceed QC criteria, non-detect data may be qualified "R".

For the PCB/PESTICIDE fraction, if %RSD exceeds 20% for all analytes except to the two surrogates (which must not exceed 30% RSD), qualify all associated positive results "J" and non-detects "UJ". If the %RPD of the continuing calibration check is greater than 25%, positive and non-detected results are estimated "J, UJ".

The following analytes in the samples shown were qualified for %RSD, %D and %RPD:

VOA instrument "MSD", initial calibration 09/18/95:

COMPOUND	IC(9/18/95)	CC(10/5/95)	CC(10/6/95)	CC(10/10/95)
Carbon disulfide		X	X	X
Associated samples:	All listed	FBTW100395	SS-02	SB-01-18.5
		SB-01-02	SS-03	SB-01-32.5
		TRIP BLK01	SS-04	SS-01
		RWSS100395	SS-05	
		TB-02	SS-06	
			SS-07	
			SS-15

3-Nitroaniline	X	X
2,4-Dinitrophenol	X	
4-Nitrophenol		X
4-Nitroaniline		X
Pentachlorophenol	X	
Benzo(g,h,i)perylene		X

COMPOUND

IC(10/4/95) CC(10/12/95)

Associated samples: All listed FBTW100395, SB-01-02,
SB-01-18.5, SB-01-32.5,
RWSS100395, SS-01, SS-02,
SS-03, SS-04, SS-05,
SS-06, SS-07, SS-15

X - %RSD > 30% or %D > 25%; Estimate (J4) positive and non-detected (UJ4)
results in the associated samples.

It should be noted that Pesticide/PCB initial and continuing standard forms 6 and 7 were not submitted in the data package. The laboratory was notified on 1/22/96. The forms were received by the validator on 01/25/96.

DATA ASSESSMENT

6. SURROGATES/SYSTEM MONITORING COMPOUNDS (SMC):

All samples are spiked with surrogate/SMC compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. If the measured surrogate/SMC concentrations were outside contract specifications, qualifications were applied to the samples and analytes as shown below. The following analytes for the samples shown were qualified because of surrogate/SMC recovery:

Pesticide/PCB surrogates TCX and DCB were under-recovered on both columns for sample SS-15 (TCX 29% and 48%, DCB 59% and 58%). Therefore, all results are estimated (J8, UJ8).

DATA ASSESSMENT

7. INTERNAL STANDARDS PERFORMANCE:

Internal Standard (IS) performance criteria ensure that the GC/MS sensitivity and response are stable during every experimental run. The internal standard area count must not vary by more than a factor of two (-50% to +100%) from the associated continuing calibration standard. The retention time of the internal standard must not vary by more than +/-30 seconds from the associated continuing calibration standard. If the area count is outside the (-50% to +100%) range of the associated standard, all of the positive results for compounds quantitated using that IS are qualified as estimated "J", and all non-detects as "UJ" only if IS area is <50%. Non-detects are qualified as "R" if there is a severe loss of sensitivity (<25% of the associated area counts).

If an internal standard retention time varies by more than 30 seconds, the reviewer will use professional judgment to determine either partial or total rejection of the data for that sample fraction. The following analytes in the samples shown were qualified because of internal standards performance: All internal standard criteria were met.

DATA ASSESSMENT

8. COMPOUND IDENTIFICATION:

A. VOLATILE AND SEMI-VOLATILE FRACTIONS

TCL compounds are identified on the GC/MS by using the analyte's relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within +/- 0.06 RRT units of the standard compound, and have an ion spectra which has a ratio of the primary and secondary m/e intensities within 20% of that in the standard compound. For tentatively identified compounds (TIC), the ion spectra must match accurately. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications. The following analytes in the samples shown were qualified for compound identification:

B. PESTICIDE FRACTIONS

The retention times of reported compounds must fall within the calculated retention time windows for the two chromatographic columns. The percent difference (%D) of the positive results obtained on the two GC columns should be $\leq 25\%$. The following analytes in the samples shown were qualified because of compound identification:

It should be noted that Heptachlor had a %D $>25\%$ in all cases. However, the compound was previously blank qualified out in all samples.

SB-01-02 - The higher result for 4,4'-DDT (2.3 ug/kg) quantitated from column DB-17 was more acceptable as the manual integration performed for the result from column DB-5 was poorly done. A perpendicular should have been dropped to the baseline and was not. The result was substituted by the validator and estimated (J25) as the %D on the two columns was 27.8%.

SS-01 - The higher result for Dieldrin (0.49 ug/kg) quantitated from column DB-17 was more acceptable as the integration performed for the result from column DB-5 was poorly done. A perpendicular should have been dropped to the baseline and was not. The result was substituted by the validator and estimated (J25) as the %D on the two columns was 48.5%.
4,4'-DDE (55.2%, JN25) and 4,4'-DDT (26.0%, J25)

SS-15 - 4,4'-DDE (47.4%, J25) and 4,4'-DDT (96.9%, R25)

SS-02 - Dieldrin (56.0%, JN25) and 4,4'-DDT (28.6%, J25)

SS-03 - Dieldrin (185.0%, R25) and 4,4'-DDD (64.3%, JN25)

SS-04 - 4,4'-DDD (29.0%, J25) The Dieldrin result is not estimated (%D 26.6%) as the diluted result SS-04DL, which had a %D $<25\%$ was used.

Attachment 1, SOP No. HW-6
SDG No.: AC009/154009

Page 13

SS-05 - 4,4'-DDT (205.1%, R25)
SS-06 - Dieldrin (29.8%, J25)
SS-07 - Dieldrin (92.3%, R25), 4,4'-DDE (31.8%, J25) and 4,4'-DDT (42.9%, J25)

DATA ASSESSMENT

9. MATRIX SPIKE/SPIKE DUPLICATE, MS/MSD:

The MS/MSD data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD may be used in conjunction with other QC criteria for some additional qualification of data. The following analytes, for the samples shown, were qualified because of the MS/MSD:

The % RPD for pesticide/PCB fraction compound Heptachlor was 38% in the MS/MSD performed on sample SS-07. Due to blank contamination action, Heptachlor was considered non-detected in sample SS-07. Therefore, qualification is not necessary.

It should be noted that the ABN fraction aqueous matrix spike blank compounds 4-Nitrophenol and Pentachlorophenol were slightly over-recovered. No action is recommended.

DATA ASSESSMENT

10. OTHER QC DATA OUT OF SPECIFICATION:

VOLATILES: It should be noted that the laboratory reference spectra for Acetone was of poor quality. The m/z ion 58 was used to quantitate acetone (the SOP requests the 43 ion to be used for quantitation). The m/z ion 91 was used to quantitate xylenes (the SOP requests the 106 ion to be used for quantitation).

The Tentatively Identified Compound forms (1B) did not include the "JN" qualifier.

The response factors are not shown on the quantitation reports.

It should be noted that transcription errors were found in the pesticide/PCB package: Upon review of raw data for sample SB-06-26.5, the validator found that the results listed for 4,4'-DDD and 4,4'-DDT from the DB-17 column were incorrect. The validator edited both the Form I and Form 10.

11. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT: Overall system performance was good.

12. CONTRACTUAL NON-COMPLIANCE: None

13. This package contains re-extraction, re-analysis or dilution. Upon reviewing the QC results, the following form I(s) and/or compounds are identified to be used:

Pesticides:

SB-06-26.5, SB-06-26.5DL

Use 4,4'-DDD and 4,4'-DDT result from diluted analysis.

Use all other detected and non-detected results from the original analysis.

SB-07-02, SB-07-02DL

Use 4,4'-DDE and 4,4'-DDT result from diluted analysis.

Use all other detected and non-detected results from the original analysis.

SB-17-33, SB-17-33DL

Use 4,4'-DDT result from diluted analysis.

Use all other detected and non-detected results from the original analysis.

CLP DATA ASSESSMENT

Appendix A.2: Data Assessment Narrative

Case No. 154009 SDG No. ANE009 Laboratory Envirotest Lab. Site Stewart ANG

Contractor Aneptek Reviewer Lorie MacKinnon

Matrix: 11 Soil/2 aq field QC

Data Assessment:

The SDG ANE009/154009 contains the following samples for analysis:

Metals/CN: 11 soil/ SB-01-02, SB-01-18.5, SB-01-32.5, SS-01, SS-15, SS-02, SS-03, SS-04, SS-05, SS-06, SS-07
2/aqueous/RW-SS-100395, FB-TW-100395

TOC: 11 soil/ SB-01-02, SB-01-18.5, SB-01-32.5, SS-01, SS-15, SS-02, SS-03, SS-04, SS-05, SS-06, SS-07

Associated QC: SS-1, SS-15 Field Duplicates

The current Functional Guidelines for evaluating inorganic data have been applied.

2.1 Validation Flags

The following flags have been applied in red by the data validator and must be considered by the data user.

J, UJ - This flag indicates the result qualified as estimated.

R - This flag indicates an unusable value. The rejected data are known to contain significant errors based on documented information and must not be used by the data user.

Usable - The results that do not carry "J" or "R" are fully usable.
Data

2.2 The Data Assessment

The inorganic data were evaluated based on the following parameters:

- * . Data Completeness
- * . Holding times
- . Calibration verification results
- . Laboratory blanks

- * . Interference check standard results
- * . Matrix spike results
- * . Duplicate analysis results
- * . Field duplicate analysis
- * . Laboratory control sample results
- * . Furnace AA results
- * . ICP serial dilution results
- * . Detection limit results
- * . Calculation and transcription checks

* - all criteria were met for this parameter.

Validation actions were taken based on the following information:

Calibration Verification

The 2xCRDL standard for Antimony was under-recovered at 78.5%. Results near the CRDL may be biased low. Estimate positive and non-detected (J2, UJ2) Antimony results which are less than 4xCRDL of 48 mg/kg. Based on this action level, all soil and aqueous Antimony results in the data group are estimated.

The 2xCRDL standard for Chromium was under-recovered at 74.8%. Results near the CRDL may be biased low. Estimate positive and non-detected (J2, UJ2) Chromium results which are less than 4xCRDL of 8 mg/kg. Based on this action level, all aqueous Chromium results in the data group are estimated.

The CRA standard for Selenium over-recovered at 127.2%. Results near the CRDL may be biased high. Estimate (J2) positive Selenium results which are less than 2xCRDL of 2 mg/kg. As all Selenium results are non-detected, there is no action.

It should be noted that the low standard of 5 ug/L was used for the Lead calibration, instead of the CRDL level of 3 ug/L. As the Lead CRA analysis standard was within control limits no action is taken.

Matrix Spike Recoveries

Antimony (39.4%), Selenium (64.0%) and Thallium (61.9%) were under-recovered in the matrix spike performed on sample SS-07. Due to a possible low bias, all Antimony, Selenium and Thallium results are estimated (J5, UJ5).

It should be noted that soil matrix spike recoveries weren't used to qualify the aqueous field QC results.

Blanks

The field blanks contained levels of several metals above the CRDL. The following table lists the maximum concentration of each metal found in the blanks

along with the resultant action level. The following field blanks were associated with the samples:

Field Blank RB-SB-100595 associated with all SB samples

<u>Element</u>	<u>Maximum Conc./Units</u>	<u>Action Level</u>
Calcium	30500 ug/L, 6100 mg/kg	30500 mg/kg
Iron	279 ug/L, 55.8 mg/kg	279 mg/kg
Manganese	16.7 ug/L, 3.3 mg/kg	16.7 mg/kg
Sodium	30100 ug/L, 6020 mg/kg	30100 mg/kg
Zinc	36.3 ug/L, 7.3 mg/kg	36.3 mg/kg

Field Blank RW-SS-100395 associated with all SS samples

<u>Element</u>	<u>Maximum Conc./Units</u>	<u>Action Level</u>
Caicium	32700 ug/L, 6540 mg/kg	32700 mg/kg
Sodium	31000 ug/L, 6200 mg/kg	31000 mg/kg

Value < Action Level; the value is rejected R3.

Value > IDL and > Action Level; the value is reported unqualified.

The action level values were compared to the sample value before application of sample dilution factors. Based on the action levels found, the following actions are taken: Calcium and Sodium results for samples SS-01, SS-15, SS-02, SS-03, SS-04, SS-05, SS-06 and SS-07 are rejected (R3). Calcium and Sodium results for samples SB0102, SB1185 and SB13253 are rejected (R3).

It should be noted that Field Blank FB-TW-100395 which is a field blank of source water used for drilling, is not used to qualify the samples based on region II validation protocol.

Furnace AA Results

Furnace AA QC data were reviewed. Duplicate injections and one-point analytical spikes were performed for each sample and analyte. All duplicate injections agreed within +/- 20%. Spike recoveries met the 85 - 115% recovery criteria for all samples with the following exception:

<u>Analyte</u>	<u>Sample ID</u>	<u>Recovery</u>	<u>Action</u>
Lead	FBTW10	121.0%	No action, result U
Lead	RWSS10	115.6%	J10
Selenium	SB0102	79.5%	J10, UJ10

<u>Analyte</u>	<u>Sample ID</u>	<u>Recovery</u>	<u>Action</u>
Selenium	SB1185	76.2%	J10, UJ10
Selenium	SB1325	77.6%	J10, UJ10
Selenium	RWSS10	83.2%	J10, UJ10
Selenium	SS-02	77.5%	J10, UJ10
Selenium	SS-03	79.6%	J10, UJ10
Selenium	SS-05	82.0%	J10, UJ10
Selenium	SS-06	78.4%	J10, UJ10
Selenium	SS-15	80.2%	J10, UJ10
Thallium	SB0102	84.4%	J10, UJ10
Thallium	SB1185	42.6%	J10, UJ10
Thallium	SB1325	59.8%	J10, UJ10
Thallium	SS-02	80.6%	J10, UJ10
Thallium	SS-05	71.2%	J10, UJ10
Thallium	SS-07	60.9%	J10, UJ10
Thallium	SS-15	63.9%	J10, UJ10

Detection Limit Results

It should be noted that the Cyanide instrument detection limit (IDL) of 1.0 mg/kg is greater than the contract required detection limit of 0.5 mg/kg. No action is recommended.

It should be noted that several ICP fraction samples were diluted at 2x as Iron (an interferent) was high. The diluted results were reported for all analytes, elevating the ICP detection limits.

CLP DATA ASSESSMENT

Appendix A.4: CLP Data Assessment Result Forms:

Spreadsheets containing the validated sample results are found at the end of the report.

- 4 - Problems, but do not affect data.

DATA VALIDATION RECOMMENDATION FOOTNOTES - ORGANICS

- J1, UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and non-detects (UJ1). Holding times have been grossly exceeded: reject all non-detects (R1).
- J2, R2 The initial or continuing calibration RF was low: estimate positive results (J2) and reject non-detects (R2).
- J4, UJ4 The initial calibration %RSD was greater than 30% or the continuing calibration %D was greater than 25%: estimate positive results (J4) and non-detects (UJ4).
- U5 Compound was present in the associated blank. Compound is present in the sample at a concentration less than the CRQL: report the CRQL (U5).
- U6 Compound was present in the associated blank. Compound was present in the sample at a concentration higher than the CRQL but lower than the "action level": qualify the result by reporting the value followed by "U" (U6). (i.e., the limit of detection has been raised for that compound, and the result is considered to be non-detect.
- J7 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was greater than the Contract Required Recovery Range (CRR): estimate positive results within that area of the chromatogram (J7).
- J8, UJ8 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was less than the CRR: estimate positive results (J8) and non-detects (UJ8) within that area of the chromatogram.
- J9, R9 One of more of the surrogate standard % recoveries was less than 10%: estimate positive results (J9) and reject non-detects (R9) within that area of the chromatogram.
- J10 The matrix spike (MS) and/or matrix spike duplicate (MSD) % recoveries were not within the CRR for this compound: estimate positive results in the unspiked sample (J10).
- J11, R11 The MS and/or MSD % recoveries were less than 10% for this compound: estimate positive results in the unspiked sample (J11) and reject non-detects (R11).
- J12 The MS/MSD %RPD for this compound was high: estimate positive results in the unspiked sample (J12).
- J13 Field duplicate %RPD was high for this compound: estimate positive results for this compound in the sample and duplicate (J13).

- J14 One or more of the Internal Standard (IS) areas were detected above the CRR; estimate the positive results for all compounds quantitated from that IS.
- J15, UJ15 One or more of the Internal standard (IS) areas were not within the CRR: estimate positive results (J15) and non-detects (UJ15) for all compounds quantitated from that IS.
- J16, R16 One or more IS areas were grossly low: estimate (J16) positive results and reject (R16) non-detects for all compounds quantitated from that IS.
- J/NJ17, R17 % Breakdown for DDT exceeded 20%: estimate positive results for DDT (J17), DDD, and DDE (NJ17) in all associated samples. If no DDT is present, but DDD and/or DDE are present: reject the CRQL (R6) for DDT. Qualify positive results for DDD and/or DDE as presumptively present at an estimated quantity (NJ17).
- J/NJ18, R18 % Breakdown for endrin exceeded 20%: estimate positive results for endrin (J18). If no endrin is present, but endrin ketone and/or endrin aldehyde are present: reject the CRQL (R7) for endrin. Qualify positive results for endrin aldehyde and endrin ketone (NJ18) as presumptively present at an estimated quantity.
- J/UJ19, R19 Initial calibration %RSD for this compound exceeded 20%: estimate positive and non-detected results (J19, UJ19) for this compound in associated samples. If %RSD exceeded 90%, flag all non-detected results as unusable (R8).
- J/UJ20, R20 Continuing calibration %RPD for this compound exceeded 25% (quantitation or confirmation column): estimate positive and non-detected results (J20, UJ20) for this compound in associated samples. If %RPD exceeded 90%, flag all non-detected results as non-usable (R9).
- J21 Compound reported above calibration range, estimate result (J21).
- J22 The continuing calibration %D exceeded 25% for a surrogate standard compound: estimate (J22) positive results for all compounds associated with the out of control surrogate in the affected samples.
- J23 Surrogate %D >25% or %RSD > 30%, estimate positive results for compounds associated with the out of control surrogate.
- R24 The initial calibration %RSD or continuing calibration %D > 90%. Reject non-detects.
- J/NJ25, R25 Pesticide compound which has concentration values differing from 25 - 50% in its two analyses. Compound result is estimated. Dual

column analysis %D is between 50 - 90%; compound result is qualified as presumptively present at an approximated quantity (NJ25). Dual column %D is greater than 90%; the compound result is rejected (R10).

- R26 Reject non-detected result. Compound detected above the calibration range and could not be quantitated to be reported.
- R27 Isomer identified at the incorrect retention time in samples and/or standards. Reject positive and non-detected results.
- R28 Quality of Spectra submitted poor for compound in question: reject compound result.

DATA VALIDATION RECOMMENDATION FOOTNOTES - INORGANICS

- J/UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and reject non-detects (R1). Samples were improperly preserved prior to analysis; estimate positive results (J1) non-detects (UJ1).
- J/UJ2, R2 Linearity was poor near the CRDL (Low levels). Estimate or reject the results within an affected area based on the recovery of the CRDL standard.
- R3 The analyte was present in the associated blank above the CRDL. The sample result was less than the action level of 5X the maximum concentration found in any blank, and has been rejected. The associated blank had a value below the negative CRDL. Results less than ten times the CRDL are rejected.
- J/UJ4, R4 The ICS recovery of an element is outside of criteria. The reported results or detection limits are estimated or rejected based on the recovery of the interference check sample.
- J/UJ5, R5 The recovery of an element is outside of control limits in the matrix spike. The reported results or detection limits are estimated or rejected based on the recovery.
- J/UJ6 The RPD for laboratory duplicate sample analysis results exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ7 The RPD for the field duplicate analysis exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ8, R8 The LCS recovery for an element is outside of criteria. The reported results are estimated or rejected based on the laboratory control sample analyte recovery.
- J9 The %RSD of duplicate injections for GFAA analysis do not agree within +/- 20%, or the laboratory performed a single burn analysis. The sample results are estimated.
- J10, UJ10 The recovery of analytical spikes for GFAA analysis is outside of control limits. Positive sample results or detection limits are estimated.
- J11 The sample required an MSA which was not performed, was performed incorrectly, or the correlation was < 0.995. The positive results are estimated.
- J12, R12 The results of the ICP Serial Dilution analysis were outside of control limits for initial concentrations equal to or greater than 10XIDL. Analyte results greater than 10XIDL or CRDL are estimated

or rejected based on %D.

- J13 The sample was less than 50% solids. Analysis using a method intended for soils might not give representative results. The results are estimated.
- J14, UJ14 Matrix spike not performed for analysis. Estimate results (J14, UJ14) based on lack of accuracy data.
- J15 Laboratory duplicate not performed for analysis. Estimate positive results (J18) greater than the CRDL based on lack of precision data.

CLP DATA ASSESSMENT

Functional Guidelines for Evaluating Organic Analysis

Case No. 154204 SDG No. AC204 Laboratory Envirotest Lab. Site Stewart ANG

Data Assessment:

The SDG AC204/154204 contains the following samples for analysis:

Volatiles: 1/aqueous/RB-SB-101095

Semi-volatiles: 1/aqueous/RB-SB-101095

Pesticides/PCBs: 1/aqueous/RB-SB-101095

Associated QC: None

The current Functional Guidelines for evaluating organic data have been applied.

All data are valid and acceptable except those analytes which have been qualified with a "J" (estimated), "N" (presumptive evidence for the presence of the material), "U" (non-detects), "R" (unusable), or "JN" (presumptive evidence for the presence of the material at an estimated value). All action detailed on the attached sheets. Spreadsheets containing the validated sample results are found at the end of the report.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant QC problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Data Reviewer: GC/MS by Elissa McDonagh Date: 02/04/96

Data Reviewer: Pest/PCB by Lorie MacKinnon Date: 02/04/96

Verified By: Lorie MacKinnon Date: 02/04/96

DATA ASSESSMENT

1. HOLDING TIME:

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detects (sample quantitation limits) will be flagged as estimated, "UJ", or "R", if the holding times are grossly exceeded.

The following analytes in the samples shown were qualified because of holding time: All samples were extracted and analyzed within the required holding times.

DATA ASSESSMENT

2. BLANK CONTAMINATION:

Quality assurance (QA) blanks, i.e., method, trip, field, or rinse blanks are prepared to identify any contamination which may have been introduced into the samples during the sample preparation or field activity. Method blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. If the concentration of the analyte is less than five times the blank contaminant level (ten times for the common contaminants), the analytes are qualified as non-detects, "U". The following analytes in the samples shown were qualified with "U" for these reasons:

Blank Actions

- Value < CRQL; report CRQL followed by "U" (U5).
- Value > CRQL and < action level; report value followed by "U" (U6).
- Value > CRQL and > action level; report value unqualified.

A. Method blank contamination:

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Heptachlor	0.006 ug/L	0.03 ug/L

The action level values were compared to the sample values and the following recommendations are recommended: No actions are made as the associated sample RB-SB-101095 is a field rinseate sample and is therefore not blank qualified.

B. Field or rinse blank contamination ("water blanks" or "distilled water blanks " are validated like any other sample):

Not applicable as the only sample in the data package is a field rinseate sample.

C. Trip blank contamination:

Not applicable as the only sample in the data package is a field rinsate sample.

DATA ASSESSMENT

3. MASS SPECTROMETER TUNING:

Tuning performance criteria are established to ensure adequate mass resolution, proper identification of compounds, and to some degree, sufficient instrument sensitivity. These criteria are not sample specific. Instrument performance is determined using standard materials. Therefore, these criteria should be met in all circumstances. The tuning standard for volatile organics is bromofluorobenzene (BFB) and for semi-volatiles is decafluorotriphenyl-phosphine (DFTPP).

If the mass calibration is in error, or missing, all associated data will be classified as unusable, "R". The following samples shown were qualified with "R" because of tuning: All tuning criteria were met.

DATA ASSESSMENT

4. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of giving acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument is giving satisfactory daily performance.

A. RESPONSE FACTOR

The response factor measures the instrument's response to specific chemical compounds. The response factor for the VOA/ABN Target Compound List (TCL) must be ≥ 0.05 in both the initial and continuing calibrations. A value < 0.05 indicates a serious detection and quantitation problem (poor sensitivity). If the mean RRF of the initial calibration or the continuing calibration has a response factor < 0.05 for any analyte, those analytes detected in environmental samples will be qualified as estimated, "J". All nondetects for those compounds will be rejected, "R". The following analytes in the samples shown were qualified because of response factor:

ABN instrument "5972-1", initial calibration 10/04/95:

<u>COMPOUND</u>	<u>IC</u> <u>(10/4/95)</u>	<u>CC</u> <u>(10/18/95)</u>
4-Nitrophenol		+

Associated samples: All listed RBSB101095

+ - RF < 0.05 ; Estimate positive results (J2) and reject non-detects (R2) in the associated samples.

DATA ASSESSMENT

5. CALIBRATION

A. PERCENT RELATIVE STANDARD DEVIATION (%RSD) AND PERCENT DIFFERENCE (%D):

Percent RSD is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent D compares the response factor of the continuing calibration check to the mean response factor (RRF) from the initial calibration. Percent D is a measure of the instrument's daily performance. Percent RSD must be < 30% and the %D must be < 25%. A value outside of these limits indicates potential detection and quantitation errors. For these reasons, all positive results are flagged as estimated, "J"; and non-detects are flagged "UJ". If the %RSD and %D grossly exceed QC criteria, non-detect data may be qualified "R".

For the PCB/PESTICIDE fraction, if %RSD exceeds 20% for all analytes except to the two surrogates (which must not exceed 30% RSD), qualify all associated positive results "J" and non-detects "UJ". If the %RPD of the continuing calibration check is greater than 25%, positive and non-detected results are estimated "J, UJ".

The following analytes in the samples shown were qualified for %RSD, %D or %RPD:

VOA instrument "MSD", initial calibration 09/18/95:

<u>COMPOUND</u>	<u>IC</u> <u>(9/18/95)</u>	<u>CC</u> <u>(10/16/95)</u>
-----------------	-------------------------------	--------------------------------

Carbon disulfide		X
------------------	--	---

Associated samples: All listed RBSB101095

ABN instrument "5972-1", initial calibration 10/04/95:

<u>COMPOUND</u>	<u>IC</u> <u>(10/4/95)</u>	<u>CC</u> <u>(10/18/95)</u>
-----------------	-------------------------------	--------------------------------

3-Nitroaniline	X	
2,4-Dinitrophenol	X	X
Pentachlorophenol	X	

Associated samples: All listed RBSB101095

X - %RSD > 30% or %D > 25%; Estimate (J4) positive and non-detected (UJ4) results in the associated samples.

DATA ASSESSMENT

6. SURROGATES/SYSTEM MONITORING COMPOUNDS (SMC):

All samples are spiked with surrogate/SMC compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. If the measured surrogate/SMC concentrations were outside contract specifications, qualifications were applied to the samples and analytes as shown below. The following analytes for the samples shown were qualified because of surrogate/SMC recovery: All surrogate recoveries were within validation guidelines.

DATA ASSESSMENT

7. INTERNAL STANDARDS PERFORMANCE:

Internal Standard (IS) performance criteria ensure that the GC/MS sensitivity and response are stable during every experimental run. The internal standard area count must not vary by more than a factor of two (-50% to +100%) from the associated continuing calibration standard. The retention time of the internal standard must not vary by more than +/-30 seconds from the associated continuing calibration standard. If the area count is outside the (-50% to +100%) range of the associated standard, all of the positive results for compounds quantitated using that IS are qualified as estimated "J", and all non-detects as "UJ" only if IS area is <50%. Non-detects are qualified as "R" if there is a severe loss of sensitivity (<25% of the associated area counts).

If an internal standard retention time varies by more than 30 seconds, the reviewer will use professional judgment to determine either partial or total rejection of the data for that sample fraction. The following analytes in the samples shown were qualified because of internal standards performance: All internal standard areas were within control limits.

DATA ASSESSMENT

8. COMPOUND IDENTIFICATION:

A. VOLATILE AND SEMI-VOLATILE FRACTIONS

TCL compounds are identified on the GC/MS by using the analyte's relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within +/- 0.06 RRT units of the standard compound, and have an ion spectra which has a ratio of the primary and secondary m/e intensities within 20% of that in the standard compound. For tentatively identified compounds (TIC), the ion spectra must match accurately. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications. The following analytes in the samples shown were qualified for compound identification: There were no qualifications based on compound identification.

B. PESTICIDE FRACTIONS

The retention times of reported compounds must fall within the calculated retention time windows for the two chromatographic columns. The percent difference (%D) of the positive results obtained on the two GC columns should be <= 25%. The following analytes in the samples shown were qualified because of compound identification:

RB-SB-101095 - Heptachlor (94%). Based on validation limits, in cases where the %D's are greater than 90%, the compound results is rejected. However, upon review of the chromatogram, it appeared that the manual integration performed on the DB-5 analysis was poorly done. A perpendicular should have been dropped to the baseline. The DB-5 result was therefore low. The validator estimated (JN25) the result due to dual column %D.

DATA ASSESSMENT

9. MATRIX SPIKE/SPIKE DUPLICATE, MS/MSD:

The MS/MSD data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD may be used in conjunction with other QC criteria for some additional qualification of data. The following analytes, for the samples shown, were qualified because of the MS/MSD:

It should be noted that the ABN fraction aqueous matrix spike blank compounds 4-Nitrophenol and Pentachlorophenol were slightly over-recovered. No action is recommended.

DATA ASSESSMENT

10. OTHER QC DATA OUT OF SPECIFICATION:

VOLATILES: It should be noted that the laboratory reference spectra for Acetone was of poor quality. The m/z ion 58 was used to quantitate acetone (the SOP requests the 43 ion to be used for quantitation).

The Tentatively Identified Compound forms (1B) did not include the "JN" qualifier.

The response factors are not shown on the quantitation reports.

11. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT: Overall system performance was good.

12. CONTRACTUAL NON-COMPLIANCE: None

Tentatively Identified Compounds

<u>Compound</u>	<u>RBSB101095</u>
	ug/L
VOA Unknown	X(8)
ABN Unknown	XX(8)

X - Tentatively Identified Compound (TIC) of this description was found in the sample.

XX - Multiple TICs of this description were found in this sample.

Rejected Tentatively Identified Compounds are not included in this table.

CLP DATA ASSESSMENT

Appendix A.2: Data Assessment Narrative

Case No. 154204 SDG No. ANE204 Laboratory Envirotest Lab. Site Stewart ANG

Contractor Aneptek Reviewer Lorie MacKinnon

Matrix: 1 aq field QC

Data Assessment:

The SDG ANE204/154204 contains the following samples for analysis:

Metals/CN: 1/aqueous/FB-SB-101095

Associated QC: None

The current Functional Guidelines for evaluating inorganic data have been applied.

2.1 Validation Flags

The following flags have been applied in red by the data validator and must be considered by the data user.

J, UJ - This flag indicates the result qualified as estimated.

R - This flag indicates an unusable value. The rejected data are known to contain significant errors based on documented information and must not be used by the data user.

Usable - The results that do not carry "J" or "R" are fully usable.
Data

2.2 The Data Assessment

The inorganic data were evaluated based on the following parameters:

- * . Data Completeness
- * . Holding times
- * . Calibration verification results
- * . Blank analysis
- * . Interference check standard results
- * . Matrix spike results
- * . Duplicate analysis results
- * . Field duplicate analysis
- * . Laboratory control sample results
- * . Furnace AA results
- * . ICP serial dilution results

- * . Detection limit results
- * . Calculation and transcription checks

* - all criteria were met for this parameter.

Validation actions were taken based on the following information:

Calibration Verification

The 2xCRDL standard for Chromium was over-recovered at 124.2% and 141.2%. Results near the CRDL may be biased high. Estimate positive (J2) Chromium results which are less than 4xCRDL of 40 ug/L. As the sample result is undetected, there is no action.

The CRA standard for Lead was over-recovered at 122%. Results near the CRDL may be biased high. Estimate (J2) positive Lead results which are less than 2xCRDL of 6 ug/L. As the sample result is undetected, there is no action.

It should be noted that the low standard of 5 ug/L was used for the Lead analysis, instead of the CRDL of 3 ug/L. As the lead result is undetected and the CRA standard was over-recovered, there is no action.

ICP Serial Dilution

A serial dilution was performed on sample RBSB101095. For initial concentrations greater than 10XIDL, the following %Ds were greater than 10% : Barium (24.1%). As 10XIDL was less than the CRDL, all Barium results greater than the CRDL are estimated (J12). Based on this action level, there are no qualifications.

CLP DATA ASSESSMENT

- 2 - Data qualified due to major problems.
- 3 - Data unacceptable.
- 4 - Problems, but do not affect data.

DATA VALIDATION RECOMMENDATION FOOTNOTES - ORGANICS

- J1, UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and non-detects (UJ1). Holding times have been grossly exceeded: reject all non-detects (R1).
- J2, R2 The initial or continuing calibration RF was low: estimate positive results (J2) and reject non-detects (R2).
- J4, UJ4 The initial calibration %RSD was greater than 30% or the continuing calibration %D was greater than 25%: estimate positive results (J4) and non-detects (UJ4).
- U5 Compound was present in the associated blank. Compound is present in the sample at a concentration less than the CRQL: report the CRQL (U5).
- U6 Compound was present in the associated blank. Compound was present in the sample at a concentration higher than the CRQL but lower than the "action level": qualify the result by reporting the value followed by "U" (U6). (i.e., the limit of detection has been raised for that compound, and the result is considered to be non-detect.
- J7 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was greater than the Contract Required Recovery Range (CRR): estimate positive results within that area of the chromatogram (J7).
- J8, UJ8 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was less than the CRR: estimate positive results (J8) and non-detects (UJ8) within that area of the chromatogram.
- J9, R9 One of more of the surrogate standard % recoveries was less than 10%: estimate positive results (J9) and reject non-detects (R9) within that area of the chromatogram.
- J10 The matrix spike (MS) and/or matrix spike duplicate (MSD) % recoveries were not within the CRR for this compound: estimate positive results in the unspiked sample (J10).
- J11, R11 The MS and/or MSD % recoveries were less than 10% for this compound: estimate positive results in the unspiked sample (J11) and reject non-detects (R11).
- J12 The MS/MSD %RPD for this compound was high: estimate positive results in the unspiked sample (J12).
- J13 Field duplicate %RPD was high for this compound: estimate positive results for this compound in the sample and duplicate (J13).

- J14 One or more of the Internal Standard (IS) areas were detected above the CRR; estimate the positive results for all compounds quantitated from that IS.
- J15, UJ15 One or more of the Internal standard (IS) areas were below the CRR: estimate positive results (J15) and non-detects (UJ15) for all compounds quantitated from that IS.
- J16, R16 One or more IS areas were grossly low: estimate (J16) positive results and reject (R16) non-detects for all compounds quantitated from that IS.
- J/NJ17, R17 % Breakdown for DDT exceeded 20%: estimate positive results for DDT (J17), DDD, and DDE (NJ17) in all associated samples. If no DDT is present, but DDD and/or DDE are present: reject the CRQL (R6) for DDT. Qualify positive results for DDD and/or DDE as presumptively present at an estimated quantity (NJ17).
- J/NJ18, R18 % Breakdown for endrin exceeded 20%: estimate positive results for endrin (J18). If no endrin is present, but endrin ketone and/or endrin aldehyde are present: reject the CRQL (R7) for endrin. Qualify positive results for endrin aldehyde and endrin ketone (NJ18) as presumptively present at an estimated quantity.
- J/UJ19, R19 Initial calibration %RSD for this compound exceeded 20%: estimate positive and non-detected results (J19, UJ19) for this compound in associated samples. If %RSD exceeded 90%, flag all non-detected results as unusable (R8).
- J/UJ20, R20 Continuing calibration %RPD for this compound exceeded 25% (quantitation or confirmation column): estimate positive and non-detected results (J20, UJ20) for this compound in associated samples. If %RPD exceeded 90%, flag all non-detected results as non-usable (R9).
- J21 Compound reported above calibration range, estimate result (J21).
- J22 The continuing calibration %D exceeded 25% for a surrogate standard compound: estimate (J22) positive results for all compounds associated with the out of control surrogate in the affected samples.
- J23 Surrogate %D >25% or %RSD > 30%, estimate positive results for compounds associated with the out of control surrogate.
- R24 The initial calibration %RSD or continuing calibration %D > 90%. Reject non-detects.
- J/NJ25, R25 Pesticide compound which has concentration values differing from 25 - 50% in its two analyses. Compound result is estimated. Dual column analysis %D is between 50 - 90%; compound result is qualified

as presumptively present at an approximated quantity (NJ25). Dual column %D is greater than 90%; the compound result is rejected (R10).

- R26 Reject non-detected result. Compound detected above the calibration range and could not be quantitated to be reported.
- R27 Isomer identified at the incorrect retention time in samples and/or standards. Reject positive and non-detected results.
- R28 Quality of Spectra submitted poor for compound in question: reject compound result.

DATA VALIDATION RECOMMENDATION FOOTNOTES - INORGANICS

- J/UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and reject non-detects (R1). Samples were improperly preserved prior to analysis; estimate positive results (J1) non-detects (UJ1).
- J/UJ2, R2 Linearity was poor near the CRDL (Low levels). Estimate or reject the results within an affected area based on the recovery of the CRDL standard.
- R3 The analyte was present in the associated blank above the CRDL. The sample result was less than the action level of 5X the maximum concentration found in any blank, and has been rejected. The associated blank had a value below the negative CRDL. Results less than ten times the CRDL are rejected.
- J/UJ4, R4 The ICS recovery of an element is outside of criteria. The reported results or detection limits are estimated or rejected based on the recovery of the interference check sample.
- J/UJ5, R5 The recovery of an element is outside of control limits in the matrix spike. The reported results or detection limits are estimated or rejected based on the recovery.
- J/UJ6 The RPD for laboratory duplicate sample analysis results exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ7 The RPD for the field duplicate analysis exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ8, R8 The LCS recovery for an element is outside of criteria. The reported results are estimated or rejected based on the laboratory control sample analyte recovery.
- J9 The %RSD of duplicate injections for GFAA analysis do not agree within +/- 20%, or the laboratory performed a single burn analysis. The sample results are estimated.
- J10, UJ10 The recovery of analytical spikes for GFAA analysis is outside of control limits. Positive sample results or detection limits are estimated.
- J11 The sample required an MSA which was not performed, was performed incorrectly, or the correlation was < 0.995. The positive results are estimated.
- J12, R12 The results of the ICP Serial Dilution analysis were outside of control limits for initial concentrations equal to or greater than 10XIDL. Analyte results greater than 10XIDL or CRDL are estimated or rejected based on %D.

- J13 The sample was less than 50% solids. Analysis using a method intended for soils might not give representative results. The results are estimated.
- J14, UJ14 Matrix spike not performed for analysis. Estimate results (J14, UJ14) based on lack of accuracy data.
- J15 Laboratory duplicate not performed for analysis. Estimate positive results (J18) greater than the CRDL based on lack of precision data.

CLP DATA ASSESSMENT

Functional Guidelines for Evaluating Organic Analysis

Case No. 154290/372 SDG No. AC290 Laboratory Envirotest Lab. Site Stewart ANG

Data Assessment:

The SDG AC290/154290/372 contains the following samples for analysis:

Volatiles: 10 soil/SB-05-02, SB-05-06, SB-05-22, SB-06-02, SB-06-26.5,
SB-06-34.5, SB-07-02, SB-07-33, SB-07-16, SB-17-33
3/aqueous/RB-SB-101295, TB-04, TB-05

Semi-volatiles: 10 soil/SB-05-02, SB-05-06, SB-05-22, SB-06-02, SB-06-26.5,
SB-06-34.5, SB-07-02, SB-07-33, SB-07-16, SB-17-33
1/aqueous/RB-SB-101295

Pesticides/PCBs: 10 soil/SB-05-02, SB-05-06, SB-05-22, SB-06-02, SB-06-26.5,
SB-06-34.5, SB-07-02, SB-07-33, SB-07-16, SB-17-33
1/aqueous/RB-SB-101295

Associated QC: SB-07-33, SB-17-33/Field duplicates

The current Functional Guidelines for evaluating organic data have been applied.

All data are valid and acceptable except those analytes which have been qualified with a "J" (estimated), "N" (presumptive evidence for the presence of the material), "U" (non-detects), "R" (unusable), or "JN" (presumptive evidence for the presence of the material at an estimated value). All action detailed on the attached sheets. Spreadsheets containing the validated sample results are found at the end of the report.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant QC problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Data reviewer: GC/MS by Elissa McDonagh Date: 02/05/96

Data reviewer: Pest/PCB by Lorie MacKinnon Date: 02/05/96

Verified By: Lorie MacKinnon Date: 02/05/96

DATA ASSESSMENT

1. HOLDING TIME:

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detects (sample quantitation limits) will be flagged as estimated, "UJ", or "R", if the holding times are grossly exceeded.

The following analytes in the samples shown were qualified because of holding time: All samples were extracted and analyzed within the required holding times.

DATA ASSESSMENT

2. BLANK CONTAMINATION:

Quality assurance (QA) blanks, i.e., method, trip, field, or rinse blanks are prepared to identify any contamination which may have been introduced into the samples during the sample preparation or field activity. Method blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. If the concentration of the analyte is less than five times the blank contaminant level (ten times for the common contaminants), the analytes are qualified as non-detects, "U". The following analytes in the samples shown were qualified with "U" for these reasons:

Blank Actions

- Value < CRQL; report CRQL followed by "U" (U5).
- Value > CRQL and < action level; report value followed by "U" (U6).
- Value > CRQL and > action level; report value unqualified.

A. Method blank contamination:

The VOA, ABN and PEST laboratory method blanks and instrument blanks contained the following maximum quantities of contaminants:

Associated samples: All soil samples in SDG

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Acetone	9 ug/kg	90 ug/kg
bis(2-ethylhexyl)phthalate	0.9 ug/L	9 ug/L
Heptachlor	0.098 ug/kg	0.49 ug/kg
4,4'-DDT	1.3 ug/kg	6.5 ug/kg

The action level value was compared to the sample values after application of the sample dilution factors and the following actions are recommended: Acetone in samples SB-05-02, SB-06-02, SB-06-26.5, SB-06-34.5, SB-07-02, SB-07-33 and SB-17-33 and 4,4'-DDT in sample SB-06-02 should be reported as the CRQL followed by a "U5". Heptachlor in samples SB-05-02, SB-05-22, SB-06-02, SB-06-26.5, SB-06-34.5, SB-07-02, SB-07-33, SB-07-16 and SB-17-33 should be reported as the CRQL followed by a "U5". Acetone in samples SB-05-06, SB-05-22 and SB-07-16 and 4,4'-DDT in sample SB-05-02 should be reported as the CRQL followed by a "U6"(i.e., the CRQL has been raised and the value is considered to be non-detected).

Pesticide/PCB fraction method blank PBLK02, associated with all SDG aqueous samples, had positive results for delta-BHC, Heptachlor, 4,4'-DDE and 4,4'-DDT. No qualification was required as all aqueous samples were field/rinse blanks and are not blank qualified.

B. Field or rinse blank contamination ("water blanks" or "distilled water blanks" are validated like any other sample)

The VOA, ABN and PEST rinse blanks contained the following maximum quantities of contaminants:

RB-SB-101095 Associated samples: All SB05 and SB06 samples in SDG

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Acetone	2 ug/L	20 ug/L
bis(2-ethylhexyl)phthalate	9 ug/L	90 ug/L
Heptachlor	0.005 ug/L or 0.167 ug/kg	0.83 ug/kg

RB-SB-101295 Associated samples: All SB07 samples in SDG.

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Acetone	2 ug/L	20 ug/L
bis(2-ethylhexyl)phthalate	3 ug/L	30 ug/L
Heptachlor	0.003 ug/L or 0.099 ug/kg	0.50 ug/kg
4,4'-DDD	0.02 ug/L or 0.66 ug/kg	3.3 ug/kg
4,4'-DDT	0.025 ug/L or 0.83 ug/kg	4.4 ug/kg

The action level value was compared to the sample values after application of the sample dilution factors and the following actions are recommended: Bis(2-ethylhexyl)phthalate in samples SB-05-02, SB-05-06, SB-05-22, SB-06-02, SB-06-26.5, SB-06-34.5 and SB-07-16 should be reported as the CRQL followed by a "U5".

C. Trip blank contamination:

Trip Blank TB-04

Associated samples: Associated samples: All SB05 and SB06 samples in SDG

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Acetone	4 ug/L	40 ug/L

The action level values were compared to the sample values and the following recommendations are recommended: All compound results were previously blank qualified due to laboratory or field blanks.

DATA ASSESSMENT

3. MASS SPECTROMETER TUNING:

Tuning performance criteria are established to ensure adequate mass resolution, proper identification of compounds, and to some degree, sufficient instrument sensitivity. These criteria are not sample specific. Instrument performance is determined using standard materials. Therefore, these criteria should be met in all circumstances. The tuning standard for volatile organics is bromofluorobenzene (BFB) and for semi-volatiles is decafluorotriphenyl-phosphine (DFTPP).

If the mass calibration is in error, or missing, all associated data will be classified as unusable, "R". The following samples shown were qualified with "R" because of tuning: All tuning criteria were met.

DATA ASSESSMENT

4. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of giving acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument is giving satisfactory daily performance.

A. RESPONSE FACTOR

The response factor measures the instrument's response to specific chemical compounds. The response factor for the VOA/ABN Target Compound List (TCL) must be ≥ 0.05 in both the initial and continuing calibrations. A value < 0.05 indicates a serious detection and quantitation problem (poor sensitivity). If the mean RRF of the initial calibration or the continuing calibration has a response factor < 0.05 for any analyte, those analytes detected in environmental samples will be qualified as estimated, "J". All nondetects for those compounds will be rejected, "R". The following analytes in the samples shown were qualified because of response factor: Response factors greater than or equal to 0.05 units.

DATA ASSESSMENT

5. CALIBRATION

A. PERCENT RELATIVE STANDARD DEVIATION (%RSD) AND PERCENT DIFFERENCE (%D):

Percent RSD is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent D compares the response factor of the continuing calibration check to the mean response factor (RRF) from the initial calibration. Percent D is a measure of the instrument's daily performance. Percent RSD must be < 30% and the %D must be < 25%. A value outside of these limits indicates potential detection and quantitation errors. For these reasons, all positive results are flagged as estimated, "J"; and non-detects are flagged "UJ". If the %RSD and %D grossly exceed QC criteria, non-detect data may be qualified "R".

For the PCB/PESTICIDE fraction, if %RSD exceeds 20% for all analytes except to the two surrogates (which must not exceed 30% RSD), qualify all associated positive results "J" and non-detects "UJ". If the %RPD of the continuing calibration check is greater than 25%, positive and non-detected results are estimated "J, UJ".

The following analytes in the samples shown were qualified for %RSD, %D or %RPD:

VOA instrument "MSD", initial calibration 09/18/95:

<u>COMPOUND</u>	<u>IC</u> <u>(9/18/95)</u>	<u>CC</u> <u>(10/16/95)</u>
-----------------	-------------------------------	--------------------------------

Carbon disulfide		X
------------------	--	---

Associated samples: All listed SB-05-02

ABN instrument "5972-1", initial calibration 10/04/95:

<u>COMPOUND</u>	<u>IC</u> <u>(10/4/95)</u>	<u>CC</u> <u>(10/19/95)</u>	<u>CC</u> <u>(10/20/95)</u>	<u>CC</u> <u>(10/21/95)</u>
-----------------	-------------------------------	--------------------------------	--------------------------------	--------------------------------

Hexachlorocyclopentadiene		X	X	
3-Nitroaniline	X	X	X	
2,4-Dinitrophenol	X			
4-Nitrophenol		X	X	X
Carbazole				X
Pentachlorophenol	X	X		

Associated samples:	All listed	SB-06-02	SB-07-02	SPBK30, SBSPK30
		SB-06-26.5	SB-07-33	
		SB-06-34.5	SB-07-16	
		SB-05-02	SB-17-33	
		SB-05-06	RBSB101295	
		SB-05-22		

X - %RSD > 30% or %D > 25%; Estimate (J4) positive and non-detected (UJ4) results in the associated samples.

<u>Compound</u>	<u>Standard</u>	<u>%RPD</u>	<u>Column</u>	<u>Associated Samples</u>
4,4'-DDT	INDAM02	27.0	DB-5	All samples

Therefore, all non-detected 4,4'-DDT results and detected results (quantitated off the DB-5 column) are estimated (J20, UJ20): SB-06-02 and RB-SB-101295.

DATA ASSESSMENT

6. SURROGATES/SYSTEM MONITORING COMPOUNDS (SMC):

All samples are spiked with surrogate/SMC compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. If the measured surrogate/SMC concentrations were outside contract specifications, qualifications were applied to the samples and analytes as shown below. The following analytes for the samples shown were qualified because of surrogate/SMC recovery: All surrogate recoveries were within validation guidelines.

It should be noted that the incorrect percent recovery information appears on the raw data for the pesticide soil fractions. Recoveries were double those listed on the Form II's. No action is taken.

DATA ASSESSMENT

7. INTERNAL STANDARDS PERFORMANCE:

Internal Standard (IS) performance criteria ensure that the GC/MS sensitivity and response are stable during every experimental run. The internal standard area count must not vary by more than a factor of two (-50% to +100%) from the associated continuing calibration standard. The retention time of the internal standard must not vary by more than +/-30 seconds from the associated continuing calibration standard. If the area count is outside the (-50% to +100%) range of the associated standard, all of the positive results for compounds quantitated using that IS are qualified as estimated "J", and all non-detects as "UJ" only if IS area is <50%. Non-detects are qualified as "R" if there is a severe loss of sensitivity (<25% of the associated area counts).

If an internal standard retention time varies by more than 30 seconds, the reviewer will use professional judgment to determine either partial or total rejection of the data for that sample fraction. The following analytes in the samples shown were qualified because of internal standards performance: All internal standard criteria were met.

DATA ASSESSMENT

8. COMPOUND IDENTIFICATION:

A. VOLATILE AND SEMI-VOLATILE FRACTIONS

TCL compounds are identified on the GC/MS by using the analyte's relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within +/- 0.06 RRT units of the standard compound, and have an ion spectra which has a ratio of the primary and secondary m/e intensities within 20% of that in the standard compound. For tentatively identified compounds (TIC), the ion spectra must match accurately. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications. The following analytes in the samples shown were qualified for compound identification: No compounds were qualified due to compound identification.

B. PESTICIDE FRACTIONS

The retention times of reported compounds must fall within the calculated retention time windows for the two chromatographic columns. The percent difference (%D) of the positive results obtained on the two GC columns should be <= 25%. The following analytes in the samples shown were qualified because of compound identification:

It should be noted that Heptachlor had a %D >25% in most samples. However, as the compound was blank qualified "U" in all samples, there is no qualification.

SB-05-02 - Dieldrin (100 %D) would be rejected. However, upon review of raw data, the manual integration was poorly performed on the DB-5 analysis. A perpendicular should have been dropped for the separation between Dieldrin and 4,4'-DDE. The higher results from the DB-17 column, which were fully resolved, were reported by the validator and estimated (JN25) due to %D.

SB-05-06 - 4,4'-DDE (31.4%, J25)

SB-05-22 - Dieldrin (66.7%) The manual integration performed for Dieldrin (4.2 mg/kg) on the DB-5 column was poorly done. The higher Dieldrin result (7.0 mg/kg) from the DB-17 column is resolved from 4,4'-DDE and appears to have no positive interferences. The validator reported the DB-17 result of 7.0 mg/kg estimated (J25).
4,4'-DDE (25.7%, J25)

SB-06-02 - 4,4'-DDE (80%, JN25), 4,4'-DDD (192.7%, R25) and 4,4'-DDT (44.4%, No action as result was blank qualified)

SB-06-26.5 Dieldrin (2816.7%, R25), 4,4'-DDE (34.9%, J25), alpha-chlordane (54.5%, JN25), gamma-chlordane (162.1%, R25), 4,4'-DDD (over-calibrated, R25) and 4,4'-DDT (over-calibrated, R25). Upon review

of raw data, the validator found that the results listed for 4,4'-DDD and 4,4'-DDT from the DB-17 column were incorrect. The validator edited both the Form I and Form 10.

- SB0626.5DL 4,4'-DDD (259.6%, R25), DB-5 column result 890 (separated) DB-17 column result 3200 peaks not resolved. As the validator felt that 4,4'-DDD was present, the DB-5 result was reported estimated (JN25).
- SB-06-34.5 4,4'-DDE (150%) The manual integration performed for 4,4'-DDE on the DB-5 column was poorly done. A perpendicular should have been dropped to the baseline giving a higher result. As the validator felt that 4,4'-DDE was present in the sample the value is estimated (JN25) instead of rejected. 4,4'-DDD (112.1%, R25) Co-elution on the DB-17 column is suspected.
It should be noted that the Form I result for 4,4'-DDT has a "P" qualifier indicating a dual column %D > 25%. However, the %D reported on the Form 10 was 5.3%. The validator removed the "P" qualifier.
- RBSB101295 4,4'-DDT (56%, JN25) and Heptachlor (146.7%, JN25) The Heptachlor result was not rejected as the manual integration performed was poorly done. A perpendicular should have been dropped to the baseline giving a higher result on the DB-5 column.
- SB-07-02 - Dieldrin (83.3%, JN25), 4,4'-DDE (71.4%, Over-calibrated), alpha-chlordane (218.2%, R25), 4,4'-DDD (over-calibrated, however, there is peak separation, JN25) and 4,4'-DDT (over-calibrated).
- SB-07-02DL 4,4'-DDE (36.8%, J25) 4,4'-DDD result %D is less than 25%. However, the validator highly suspects co-elution on both columns as the peak shape is extremely broad on the DB-5 column and the dilution does not agree with original analysis, in which two peaks were present in the area. The 4,4'-DDD diluted result is not used.
- SB-07-33- 4,4'-DDE (80%, JN25) and 4,4'-DDD (75.4%, JN25)
- SB-07-16- 4,4'-DDD (45.5%, J25)
- SB-17-33- 4,4'-DDD (73.9%, JN25) Result on DB-17 column is over-calibrated. Not over-calibrated on quantitated DB-5 column.
- SB-17-33DL 4,4'-DDD (200%, R25)

DATA ASSESSMENT

9. MATRIX SPIKE/SPIKE DUPLICATE, MS/MSD:

The MS/MSD data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD may be used in conjunction with other QC criteria for some additional qualification of data. The following analytes, for the samples shown, were qualified because of the MS/MSD:

It should be noted that the ABN fraction aqueous matrix spike blank compounds 4-Nitrophenol and Pentachlorophenol were slightly over-recovered. The ABN fraction soil matrix spike blank compound Pentachlorophenol was slightly over-recovered. No action is recommended.

It should be noted that insufficient sample was received to prepare an actual ABN sample matrix spike/matrix spike duplicate. Laboratory reagent was used to prepare the MS/MSD.

DATA ASSESSMENT

10. OTHER QC DATA OUT OF SPECIFICATION:

VOLATILES: It should be noted that the laboratory reference spectra for Acetone was of poor quality. The m/z ion 58 was used to quantitate acetone (the SOP requests the 43 ion to be used for quantitation). The m/z ion 91 was used to quantitate xylenes (the SOP requests the 106 ion to be used for quantitation).

The Tentatively Identified Compound forms (1B) did not include the "JN" qualifier.

The response factors are not shown on the quantitation reports.

It should be noted that transcription errors were found in the pesticide/PCB package: Upon review of raw data for sample SB-06-26.5, the validator found that the results listed for 4,4'-DDD and 4,4'-DDT from the DB-17 column were incorrect. The validator edited both the Form I and Form 10.

11. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT: Overall system performance was good.

12. CONTRACTUAL NON-COMPLIANCE: None

13. This package contains re-extraction, re-analysis or dilution. Upon reviewing the QC results, the following form I(s) and/or compounds are identified to be used:

Pesticides:

SB-06-26.5, SB-06-26.5DL

Use 4,4'-DDD and 4,4'-DDT result from diluted analysis.
Use all other detected and non-detected results from the original analysis.

SB-07-02, SB-07-02DL

Use 4,4'-DDE and 4,4'-DDT result from diluted analysis.
Use all other detected and non-detected results from the original analysis.

SB-17-33, SB-17-33DL

Use 4,4'-DDT result from diluted analysis.
Use all other detected and non-detected results from the original analysis.

XX - Multiple TICs of this description were found in this sample.

Rejected Tentatively Identified Compounds are not included in this table.

CLP DATA ASSESSMENT

Appendix A.2: Data Assessment Narrative

Case No. 154290/372 SDG No. ANE290 Laboratory Envirotest Lab. Site Stewart ANG

Contractor Aneptek Reviewer Lorie MacKinnon

Matrix: 10 Soil/1 aq field QC

Data Assessment:

The SDG ANE290/154290/154372 contains the following samples for analysis:

Metals/CN: 10 soil/SB-05-02, SB-05-06, SB-05-22, SB-06-02, SB-06-26.5,
SB-06-34.5, SB-07-02, SB-07-33, SB-07-16, SB-17-33
1/aqueous/RB-SB-101295

TOC: 10 soil/SB-05-02, SB-05-06, SB-05-22, SB-06-02, SB-06-26.5,
SB-06-34.5, SB-07-02, SB-07-33, SB-07-16, SB-17-33

Associated QC: SB-07-33, SB-17-33/Field duplicates

The current Functional Guidelines for evaluating inorganic data have been applied.

2.1 Validation Flags

The following flags have been applied in red by the data validator and must be considered by the data user.

J, UJ - This flag indicates the result qualified as estimated.

R - This flag indicates an unusable value. The rejected data are known to contain significant errors based on documented information and must not be used by the data user.

Usable - The results that do not carry "J" or "R" are fully usable.
Data

2.2 The Data Assessment

The inorganic data were evaluated based on the following parameters:

- * . Data Completeness
- * . Holding times
- . Calibration verification results
- . Blank analysis
- * . Interference check standard results
- . Matrix spike results

- * . Duplicate analysis results
- * . Field duplicate analysis
- * . Laboratory control sample results
- . Furnace AA results
- . ICP serial dilution results
- * . Detection limit results
- * . Calculation and transcription checks

* - all criteria were met for this parameter.

Validation actions were taken based on the following information:

Calibration Verification

The 2xCRDL standard for Antimony was under-recovered at 77.3%. Results near the CRDL may be biased low. Estimate positive and non-detected (J2, UJ2) Chromium results which are less than 4xCRDL of 48 mg/kg or 240 ug/L. Based on this action level, Antimony results for samples SB-05-02, SB-05-06, SB-05-22, SB-06-02, SB-06-26.5, SB-06-34.5, SB-07-02, SB-07-33, SB-07-16, SB-17-33 and RB-SB-101295 are estimated.

The CRA standard for Lead was over-recovered at 123.7%. Results near the CRDL may be biased high. Estimate (J2) positive Lead results which are less than 2xCRDL of 1.2 mg/kg or 6 ug/L. However, as the sample lead results are greater than this level, there is no action.

It should be noted that the low standard of 5 ug/L was used for the Lead analysis, instead of the CRDL of 3 ug/L. As all lead results are greater than 5X the CRDL, there is no action.

Matrix Spike Recoveries

Antimony (50.2%), Lead (133.9%) and Thallium (52.3%) were recovered outside of the control limits in the matrix spike performed on sample SB-05-02. Due to a possible low bias, all Antimony and Thallium results are estimated (J5, UJ5). Due to a possible high bias, all positive Lead results are estimated (J5).

It should be noted that the Cyanide result for sample SB-05-22 was flagged with an "N" qualifier (matrix recovery out of control limits) and shouldn't have been. The validator edited the Form I.

It should be noted that the validator did not apply the matrix spike actions to the aqueous field QC sample.

Blanks

The field blanks contained levels of several metals above the CRDL. The following table lists the maximum concentration of each metal found in the blanks along with the resultant action level. It should be noted that Field rinseate

sample RB-SB-101295 was submitted in data package SDG 154204.

Field Blank RB-SB-101095 associated with all SB-05 and SB-06 SDG samples

<u>Element</u>	<u>Maximum Conc./Units</u>	<u>Action Level</u>
Calcium	32500 ug/L, 6500 mg/kg	32500 mg/kg
Iron	129 ug/L, 25.8 mg/kg	129 mg/kg
Sodium	30900 ug/L, 6180 mg/kg	30900 mg/kg
Manganese	17.6 ug/L, 3.52 mg/kg	17.6 mg/kg

Value < Action Level; the value is rejected R3.

Value > IDL and > Action Level; the value is reported unqualified.

The action level values were compared to the sample value before application of sample dilution factors. Based on the action levels found, the following actions are taken: Calcium and Sodium results for samples SB-05-02, SB-05-06, SB-05-22, SB-06-02, SB-06-26.5 and SB-06-34.5 are rejected (R3).

Field Blank RB-SB-101295 associated with all SB-07 SDG samples

<u>Element</u>	<u>Maximum Conc./Units</u>	<u>Action Level</u>
Aluminum	317 ug/L, 63.4 mg/kg	317 mg/kg
Iron	409 ug/L, 81.8 mg/kg	409 mg/kg
Zinc	31.4 ug/L, 6.28 mg/kg	31.4 mg/kg

Value < Action Level; the value is rejected R3.

Value > IDL and > Action Level; the value is reported unqualified.

The action level values were compared to the sample value before application of sample dilution factors. All sample levels were greater than the action levels. No qualifications are necessary.

Furnace AA Results

Furnace AA QC data were reviewed. Duplicate injections and one-point analytical spikes were performed for each sample and analyte. All duplicate injections agreed within +/- 20%. Spike recoveries met the 85 - 115% recovery criteria for all samples with the following exception:

<u>Analyte</u>	<u>Sample ID</u>	<u>Recovery</u>	<u>Action</u>
Selenium	SB0716	82%	J10, UJ10
Thallium	SB0502	62.8%	J10, UJ10
Thallium	SB0506	64.4%	J10, UJ10
Thallium	SB0522	68.0%	J10, UJ10
Thallium	SB0602	56.9%	J10, UJ10

<u>Analyte</u>	<u>Sample ID</u>	<u>Recovery</u>	<u>Action</u>
Thallium	SB06-26.5	75.8%	J10, UJ10
Thallium	SB06-34.5	82.4%	J10, UJ10
Thallium	SB0702	68.4%	J10, UJ10
Thallium	SB0716	79.1%	J10, UJ10

ICP Serial Dilution

A serial dilution was performed on sample SB-05-02. For initial concentrations greater than 10XIDL, the following %Ds were greater than 10% : Potassium (24.5%) and Zinc (19.6%). As 10XIDL was less than the CRDL in all cases, all Potassium and Zinc results greater than the CRDL are estimated (J12).

It should be noted that the validator did not apply the serial dilution actions to the aqueous sample.

Detection Limit Results

It should be noted that ICP samples SB-06-34.5, SB-06-02 and SB-05-06 were diluted as Iron levels were close to or exceeded the calibration range. The diluted results for all analytes were reported, thus elevating the instrument detection limits (IDL) for all ICP analytes for the samples. A prescan was performed with the samples undiluted, however the laboratory did not submit it in the data package according to the SOW. No action is taken, as the non-detected results were less than the CRDL in all cases.

CLP DATA ASSESSMENT

Appendix A.4: CLP Data Assessment Result Forms:

Spreadsheets containing the validated sample results are found at the end of the report.

Appendix A.5:

- 1 - Data has no problems/or qualified due to minor problems.
- 2 - Data qualified due to major problems.
- 3 - Data unacceptable.
- 4 - Problems, but do not affect data.

DATA VALIDATION RECOMMENDATION FOOTNOTES - ORGANICS

- J1, UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and non-detects (UJ1). Holding times have been grossly exceeded: reject all non-detects (R1).
- J2, R2 The initial or continuing calibration RF was low: estimate positive results (J2) and reject non-detects (R2).
- J4, UJ4 The initial calibration %RSD was greater than 30% or the continuing calibration %D was greater than 25%: estimate positive results (J4) and non-detects (UJ4).
- U5 Compound was present in the associated blank. Compound is present in the sample at a concentration less than the CRQL: report the CRQL (U5).
- U6 Compound was present in the associated blank. Compound was present in the sample at a concentration higher than the CRQL but lower than the "action level": qualify the result by reporting the value followed by "U" (U6). (i.e., the limit of detection has been raised for that compound, and the result is considered to be non-detect.
- J7 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was greater than the Contract Required Recovery Range (CRR): estimate positive results within that area of the chromatogram (J7).
- J8, UJ8 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was less than the CRR: estimate positive results (J8) and non-detects (UJ8) within that area of the chromatogram.
- J9, R9 One of more of the surrogate standard % recoveries was less than 10%: estimate positive results (J9) and reject non-detects (R9) within that area of the chromatogram.
- J10 The matrix spike (MS) and/or matrix spike duplicate (MSD) % recoveries were not within the CRR for this compound: estimate positive results in the unspiked sample (J10).
- J11, R11 The MS and/or MSD % recoveries were less than 10% for this compound: estimate positive results in the unspiked sample (J11) and reject non-detects (R11).
- J12 The MS/MSD %RPD for this compound was high: estimate positive results in the unspiked sample (J12).
- J13 Field duplicate %RPD was high for this compound: estimate positive results for this compound in the sample and duplicate (J13).

- J14 One or more of the Internal Standard (IS) areas were detected above the CRR; estimate the positive results for all compounds quantitated from that IS.
- J15, UJ15 One or more of the Internal standard (IS) areas was less than the CRR: estimate positive results (J15) and non-detects (UJ15) for all compounds quantitated from that IS.
- J16, R16 One or more IS areas were grossly low: estimate (J16) positive results and reject (R16) non-detects for all compounds quantitated from that IS.
- J/NJ17, R17 % Breakdown for DDT exceeded 20%: estimate positive results for DDT (J17), DDD, and DDE (NJ17) in all associated samples. If no DDT is present, but DDD and/or DDE are present: reject the CRQL (R6) for DDT. Qualify positive results for DDD and/or DDE as presumptively present at an estimated quantity (NJ17).
- J/NJ18, R18 % Breakdown for endrin exceeded 20%: estimate positive results for endrin (J18). If no endrin is present, but endrin ketone and/or endrin aldehyde are present: reject the CRQL (R7) for endrin. Qualify positive results for endrin aldehyde and endrin ketone (NJ18) as presumptively present at an estimated quantity.
- J/UJ19, R19 Initial calibration %RSD for this compound exceeded 20%: estimate positive and non-detected results (J19, UJ19) for this compound in associated samples. If %RSD exceeded 90%, flag all non-detected results as unusable (R8).
- J/UJ20, R20 Continuing calibration %RPD for this compound exceeded 25% (quantitation or confirmation column): estimate positive and non-detected results (J20, UJ20) for this compound in associated samples. If %RPD exceeded 90%, flag all non-detected results as non-usable (R9).
- J21 Compound reported above calibration range, estimate result (J21).
- J22 The continuing calibration %D exceeded 25% for a surrogate standard compound: estimate (J22) positive results for all compounds associated with the out of control surrogate in the affected samples.
- J23 Surrogate %D >25% or %RSD > 30%, estimate positive results for compounds associated with the out of control surrogate.
- R24 The initial calibration %RSD or continuing calibration %D > 90%. Reject non-detects.
- J/NJ25, R25 Pesticide compound which has concentration values differing from 25 - 50% in its two analyses. Compound result is estimated. Dual column analysis %D is between 50 - 90%; compound result is qualified

as presumptively present at an approximated quantity (NJ25). Dual column %D is greater than 90%; the compound result is rejected (R10).

- R26 Reject non-detected result. Compound detected above the calibration range and could not be quantitated to be reported.
- R27 Isomer identified at the incorrect retention time in samples and/or standards. Reject positive and non-detected results.
- R28 Quality of Spectra submitted poor for compound in question: reject compound result.

DATA VALIDATION RECOMMENDATION FOOTNOTES - INORGANICS

- J/UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and reject non-detects (R1). Samples were improperly preserved prior to analysis; estimate positive results (J1) non-detects (UJ1).
- J/UJ2, R2 Linearity was poor near the CRDL (Low levels). Estimate or reject the results within an affected area based on the recovery of the CRDL standard.
- R3 The analyte was present in the associated blank above the CRDL. The sample result was less than the action level of 5X the maximum concentration found in any blank, and has been rejected. The associated blank had a value below the negative CRDL. Results less than ten times the CRDL are rejected.
- J/UJ4, R4 The ICS recovery of an element is outside of criteria. The reported results or detection limits are estimated or rejected based on the recovery of the interference check sample.
- J/UJ5, R5 The recovery of an element is outside of control limits in the matrix spike. The reported results or detection limits are estimated or rejected based on the recovery.
- J/UJ6 The RPD for laboratory duplicate sample analysis results exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ7 The RPD for the field duplicate analysis exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ8, R8 The LCS recovery for an element is outside of criteria. The reported results are estimated or rejected based on the laboratory control sample analyte recovery.
- J9 The %RSD of duplicate injections for GFAA analysis do not agree within +/- 20%, or the laboratory performed a single burn analysis. The sample results are estimated.
- J10, UJ10 The recovery of analytical spikes for GFAA analysis is outside of control limits. Positive sample results or detection limits are estimated.
- J11 The sample required an MSA which was not performed, was performed incorrectly, or the correlation was < 0.995. The positive results are estimated.
- J12, R12 The results of the ICP Serial Dilution analysis were outside of control limits for initial concentrations equal to or greater than 10XIDL. Analyte results greater than 10XIDL or CRDL are estimated or rejected based on %D.

- J13 The sample was less than 50% solids. Analysis using a method intended for soils might not give representative results. The results are estimated.
- J14, UJ14 Matrix spike not performed for analysis. Estimate results (J14, UJ14) based on lack of accuracy data.
- J15 Laboratory duplicate not performed for analysis. Estimate positive results (J18) greater than the CRDL based on lack of precision data.

CLP DATA ASSESSMENT

Functional Guidelines for Evaluating Organic Analysis

Case No. 154477/478 SDG No. AC477 Laboratory Envirotest Lab. Site Stewart ANG

Data Assessment:

The SDG AC477/154477/478 contains the following samples for analysis:

Volatiles: 3 soil/MW-01-04, MW-01-18, MW-01-31.6
3/aqueous/TB-3, DW-01-101795, TB-DW-01

Semi-volatiles: 3 soil/MW-01-04, MW-01-18, MW-01-31.6
1/aqueous/DW-01-101795

Pesticides/PCBs: 3 soil/MW-01-04, MW-01-18, MW-01-31.6
1/aqueous/DW-01-101795

Associated QC: None

The current Functional Guidelines for evaluating organic data have been applied.

All data are valid and acceptable except those analytes which have been qualified with a "J" (estimated), "N" (presumptive evidence for the presence of the material); "U" (non-detects), "R" (unusable), or "JN" (presumptive evidence for the presence of the material at an estimated value). All action detailed on the attached sheets. Spreadsheets containing the validated sample results are found at the end of the report.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant QC problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Data reviewer: GC/MS by Elissa McDonagh Date: 02/05/96

Data reviewer: Pest/PCB by Lorie MacKinnon Date: 02/05/96

Verified By: Lorie MacKinnon Date: 02/05/96

DATA ASSESSMENT

1. HOLDING TIME:

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detects (sample quantitation limits) will be flagged as estimated, "UJ", or "R", if the holding times are grossly exceeded.

The following analytes in the samples shown were qualified because of holding time: All samples were extracted and analyzed within the required holding times.

DATA ASSESSMENT

2. BLANK CONTAMINATION:

Quality assurance (QA) blanks, i.e., method, trip, field, or rinse blanks are prepared to identify any contamination which may have been introduced into the samples during the sample preparation or field activity. Method blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. If the concentration of the analyte is less than five times the blank contaminant level (ten times for the common contaminants), the analytes are qualified as non-detects, "U". The following analytes in the samples shown were qualified with "U" for these reasons:

Blank Actions

- Value < CRQL; report CRQL followed by "U" (U5).
- Value > CRQL and < action level; report value followed by "U" (U6).
- Value > CRQL and > action level; report value unqualified.

A. Method blank contamination:

The VOA, ABN and PEST laboratory method blank contained the following maximum quantities of contaminants:

Aqueous method blank: Associated sample DW-01-101795

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
bis(2-ethylhexyl)phthalate	5 ug/L	50 ug/L
Heptachlor	0.004 ug/L	0.020 ug/L
4,4'-DDT	0.021 ug/L	0.105 ug/L

Soil method blank: Associated samples: All soil SDG samples

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Acetone	33 ug/kg	330 ug/kg
Di-n-butyl phthalate	230 ug/kg	2300 ug/kg
Heptachlor	0.22 ug/Kg	1.1 ug/Kg
4,4'-DDT	0.25 ug/Kg	1.25 ug/Kg

The action level value was compared to the sample values after application of the sample dilution factors and the following actions are recommended. Acetone in samples MW-01-04, MW-01-18RE, MW-01-31.6 and MW-01-31.6RE, di-n-butyl phthalate in samples MW-01-04, MW-01-18 and MW-01-31.6 and Heptachlor in samples DW-01-101795, MW-01-31.6, MW-01-04 and MW-01-18 are reported as the CRQL followed by a "U5". Acetone in sample MW-01-18 should be reported as the value followed by "U6" (i.e., the CRQL has been raised and the value is considered to be non-detected).

B. Field or rinse blank contamination ("water blanks" or "distilled water blanks " are validated like any other sample)

Rinse blank RB-SB-101295 (included in SDG 154290) is associated with the SDG soil samples. Field sample DW-01-101795 is a field water sample from tub and is qualified as any other water sample.

The VOA, ABN and PEST rinse blanks contained the following maximum quantities of contaminants:

RB-SB-101295 Associated samples: All soil samples in SDG

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Acetone	2 ug/L	20 ug/L
bis(2-ethylhexyl)phthalate	3 ug/L	30 ug/L
Heptachlor	0.003 ug/L or 0.10 ug/kg	0.50 ug/kg
4,4' - DDD	0.02 ug/L or 0.67 ug/kg	3.33 ug/kg
4,4 - DDT	0.025 ug/L or 0.83 ug/kg	4.16 ug/kg

The action level value was compared to the sample values after application of the sample dilution factors and the following actions are recommended: bis(2-ethylhexyl)phthalate in sample MW-01-18 should be reported as the CRQL followed by "U5".

C. Trip blank contamination:

Trip Blank TB-DW-01

Associated samples: DW01101795

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Methylene Chloride	2 ug/L	20 ug/L
Acetone	9 ug/L	90 ug/L

The action level values were compared to the sample values and the following recommendations are recommended: Acetone in sample DW011017 should be reported as the CRQL followed by "U5".

DATA ASSESSMENT

3. MASS SPECTROMETER TUNING:

Tuning performance criteria are established to ensure adequate mass resolution, proper identification of compounds, and to some degree, sufficient instrument sensitivity. These criteria are not sample specific. Instrument performance is determined using standard materials. Therefore, these criteria should be met in all circumstances. The tuning standard for volatile organics is bromofluorobenzene (BFB) and for semi-volatiles is decafluorotriphenyl-phosphine (DFTPP).

If the mass calibration is in error, or missing, all associated data will be classified as unusable, "R". The following samples shown were qualified with "R" because of tuning: All tuning criteria were met.

DATA ASSESSMENT

4. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of giving acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument is giving satisfactory daily performance.

A. RESPONSE FACTOR

The response factor measures the instrument's response to specific chemical compounds. The response factor for the VOA/ABN Target Compound List (TCL) must be ≥ 0.05 in both the initial and continuing calibrations. A value < 0.05 indicates a serious detection and quantitation problem (poor sensitivity). If the mean RRF of the initial calibration or the continuing calibration has a response factor < 0.05 for any analyte, those analytes detected in environmental samples will be qualified as estimated, "J". All nondetects for those compounds will be rejected, "R". The following analytes in the samples shown were qualified because of response factor:

ABN instrument "5972-1", initial calibration 10/04/95:

<u>COMPOUND</u>	<u>IC</u> <u>(10/4/95)</u>	<u>CC</u> <u>(11/02/95)</u>
3-Nitroaniline		+
Associated samples:	All listed	MW-01-04, MW-01-18 MW-01-31.6

VOA instrument "MSD", initial calibration 10/17/95:

<u>COMPOUND</u>	<u>IC</u> <u>(10/17/95)</u>	<u>CC</u> <u>(10/24/95)</u>
Acetone	+	+
2-Butanone	+	+
Associated samples:	All aqueous listed	DW-011017 TB-DW-01

+ - RF < 0.05 ; Estimate positive results (J2) and reject non-detects (R2) in the associated samples.

DATA ASSESSMENT

5. CALIBRATION

A. PERCENT RELATIVE STANDARD DEVIATION (%RSD) AND PERCENT DIFFERENCE (%D):

Percent RSD is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent D compares the response factor of the continuing calibration check to the mean response factor (RRF) from the initial calibration. Percent D is a measure of the instrument's daily performance. Percent RSD must be < 30% and the %D must be < 25%. A value outside of these limits indicates potential detection and quantitation errors. For these reasons, all positive results are flagged as estimated, "J"; and non-detects are flagged "UJ". If the %RSD and %D grossly exceed QC criteria, non-detect data may be qualified "R".

For the PCB/PESTICIDE fraction, if %RSD exceeds 20% for all analytes except to the two surrogates (which must not exceed 30% RSD), qualify all associated positive results "J" and non-detects "UJ". If the %RPD of the continuing calibration check is greater than 25%, positive and non-detected results are estimated "J, UJ".

The following analytes in the samples shown were qualified for %RSD, %D or %RPD:

ABN instrument "5972-1", initial calibration 10/04/95:

<u>COMPOUND</u>	<u>IC</u> <u>(10/4/95)</u>	<u>CC</u> <u>(10/24/95)</u>	<u>CC</u> <u>(11/02/95)</u>
4-Chloroaniline			X
2-Nitroaniline			X
3-Nitroaniline	X		X
2,4-Dinitrophenol	X		
4-Nitrophenol		X	
Carbazole			X
Pentachlorophenol	X	X	
3,3'-Dichlorobenzidine			X
Di-n-octylphthalate			X
Dibenz(a,h)anthracene		X	

Associated samples: All listed DW01101795 MW-01-04, MW-01-18
MW-01-31.6

X - %RSD > 30% or %D > 25%; Estimate (J4) positive and non-detected (UJ4) results in the associated samples.

Pesticides:

<u>Compound</u>	<u>Standard</u>	<u>Time</u>	<u>%RPD</u>	<u>Column</u>	<u>Associated Samples</u>
Alpha-BHC	PEM01	11/15 11:32	30.0	DB-5	All samples
Beta-BHC	PEM01	11/15 11:32	40.0	DB-5	All samples
Endrin	PEM01	11/15 11:32	34.0	DB-5	All samples
4,4'- DDT	PEM01	11/15 11:32	41.0	DB-5	All samples
Methoxychlor	PEM01	11/15 11:32	44.0	DB-5	All samples
Alpha-BHC	PEM01	11/15 11:32	30.0	DB-17	All samples
Endrin	PEM01	11/15 11:32	32.0	DB-17	All samples
4,4'- DDT	PEM01	11/15 11:32	39.0	DB-17	All samples
Methoxychlor	PEM01	11/15 11:32	44.0	DB-17	All samples
Beta-BHC	PEM02	11/15 20:11	30.0	DB-5	All samples

Therefore, all affected results are estimated (J20, UJ20).

DATA ASSESSMENT

6. SURROGATES/SYSTEM MONITORING COMPOUNDS (SMC):

All samples are spiked with surrogate/SMC compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. If the measured surrogate/SMC concentrations were outside contract specifications, qualifications were applied to the samples and analytes as shown below. The following analytes for the samples shown were qualified because of surrogate/SMC recovery:

The VOA surrogate Bromofluorobenzene was under-recovered in the soil samples MW-01-18 and MW-01-31.6. It is recommended to estimate the positive results and non-detects (J8, UJ8) for all compounds associated with this surrogate.

The ABN surrogate Phenol-d5 was recovered at less than 10% in the MS/MSD set prepared using laboratory tap water. No action is recommended.

It should be noted that ABN surrogates 2-Fluorobiphenyl and 2-Chlorophenol-d4 were under-recovered in the aqueous sample DW01101795. No action is recommended.

Pesticide surrogates TCX (11%, 31%) and DCB (20%, 22%) were under-recovered on both columns in the sample DW-01-101795. It is recommended to estimate all positive and non-detected (J8, UJ8) results for the sample.

It should be noted that the incorrect percent recovery information appears on the raw data for the pesticide soil fractions. Recoveries were double those listed on the Form II's. No action is taken.

DATA ASSESSMENT

7. INTERNAL STANDARDS PERFORMANCE:

Internal Standard (IS) performance criteria ensure that the GC/MS sensitivity and response are stable during every experimental run. The internal standard area count must not vary by more than a factor of two (-50% to +100%) from the associated continuing calibration standard. The retention time of the internal standard must not vary by more than +/-30 seconds from the associated continuing calibration standard. If the area count is outside the (-50% to +100%) range of the associated standard, all of the positive results for compounds quantitated using that IS are qualified as estimated "J", and all non-detects as "UJ" only if IS area is <50%. Non-detects are qualified as "R" if there is a severe loss of sensitivity (<25% of the associated area counts).

If an internal standard retention time varies by more than 30 seconds, the reviewer will use professional judgment to determine either partial or total rejection of the data for that sample fraction. The following analytes in the samples shown were qualified because of internal standards performance:

The VOA internal standard Chlorobenzene-d5 was under-recovered in the soil samples MW-01-18, MW-01-31.6, MW-01-18RE and MW-01-31.6RE. It is recommended to estimate the positive results (J15) and non-detects (UJ15) for all compounds quantitated from the internal standard in the associated samples.

DATA ASSESSMENT

8. COMPOUND IDENTIFICATION:

A. VOLATILE AND SEMI-VOLATILE FRACTIONS

TCL compounds are identified on the GC/MS by using the analyte's relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within +/- 0.06 RRT units of the standard compound, and have an ion spectra which has a ratio of the primary and secondary m/e intensities within 20% of that in the standard compound. For tentatively identified compounds (TIC), the ion spectra must match accurately. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications. The following analytes in the samples shown were qualified for compound identification: There were no qualifications based on compound identification.

B. PESTICIDE FRACTIONS

The retention times of reported compounds must fall within the calculated retention time windows for the two chromatographic columns. The percent difference (%D) of the positive results obtained on the two GC columns should be $\leq 25\%$. The following analytes in the samples shown were qualified because of compound identification:

It should be noted that Heptachlor had a %D $>25\%$ in most samples. However, as the compound was blank qualified "U" in all samples, there is no qualification.

DW-01-1017- Alpha-chlordane (185.7%, R25), gamma-chlordane (370.0%, R25), 4,4'-DDD (84.1%, JN25 over-calibrated) and 4,4'-DDT (42.2%, J25 over-calibrated).

DW011017DL- 4,4'-DDD (63.6%, JN25)

DATA ASSESSMENT

9. MATRIX SPIKE/SPIKE DUPLICATE, MS/MSD:

The MS/MSD data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD may be used in conjunction with other QC criteria for some additional qualification of data. The following analytes, for the samples shown, were qualified because of the MS/MSD:

It should be noted that the ABN aqueous and soil MS/MSD sets were performed on laboratory tap water due to insufficient sample volume. Recoveries and percent RPDs were outside of control limits. However, as qualifications are done on the native sample only, there is no action on the SDG samples.

The ABN matrix spike compounds Phenol, 4-Chloro-3-methylphenol, Acenaphthene and Pyrene were recovered outside of the QC recovery limits in the aqueous matrix spike. The ABN matrix spike compounds Phenol, 1,4-Dichlorobenzene, 4-Chloro-3-methylphenol, Acenaphthene and Pyrene were recovered outside of the QC recovery limits in the aqueous matrix spike duplicate. The %RPDs were high for the matrix spike compounds Phenol, 1,4-Dichlorobenzene and 4-Chloro-3-methylphenol. No action is recommended.

The ABN matrix spike compound Pentachlorophenol was recovered outside of the QC recovery limits in the soil matrix spike duplicate. No action is recommended.

It should be noted that the PEST aqueous and soil MS/MSD sets were performed as batch QC. Recoveries and percent RPDs were outside of control limits. However, as qualifications are done on the native sample only, there is no action on the SDG samples. All pesticide matrix spike blank recoveries were found to be within control limits.

DATA ASSESSMENT

10. OTHER QC DATA OUT OF SPECIFICATION:

VOLATILES: It should be noted that the laboratory reference spectra for Acetone was of poor quality. The m/z ion 58 was used to quantitate acetone (the SOP requests the 43 ion to be used for quantitation).

The Tentatively Identified Compound forms (1B) did not include the "JN" qualifier.

The response factors are not shown on the quantitation reports.

11. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT: Overall system performance was good.

12. CONTRACTUAL NON-COMPLIANCE: None

13. This package contains re-extraction, re-analysis or dilution. Upon reviewing the QC results, the following form I(s) and/or compounds are identified to be used:

Volatiles:

MW-01-18, MW-01-18RE

Use the positive and non-detected results from the re-analysis.

MW-01-31.6, MW-01-31.6RE

Use the positive and non-detected results from the re-analysis.

Pesticides:

DW-01-1017, DW-01-1017DL

Use 4,4'-DDD and 4,4'-DDT result from diluted analysis.

Use all other results from undiluted analysis.

DATA ASSESSMENT

Tentatively Identified Compounds

<u>Compound</u>	<u>MW-01-18</u> ug/kg	<u>MW-01-31.6</u> ug/kg	<u>MW0131.6RE</u> ug/kg	<u>DW01101795</u> ug/kg
ABN Unknown	X(76)	X(86)		XX(159)

Tetradecane			X(8)	

X - Tentatively Identified Compound (TIC) of this description was found in the sample.

XX - Multiple TICs of this description were found in this sample.

Rejected Tentatively Identified Compounds are not included in this table.

CLP DATA ASSESSMENT

Appendix A.2: Data Assessment Narrative

Case No. 154477/478 SDG No. ANE478 Laboratory Envirotest Lab. Site Stewart ANG

Contractor Aneptek Reviewer Lorie MacKinnon

Matrix: 3 Soil/1 Aqueous

Data Assessment:

The SDG ANE477/154477/154478 contains the following samples for analysis:

Metals/CN: 3 soil/MW-01-04, MW-01-18, MW-01-31.6
1/aqueous/DW-01-101795

TOC: 3 soil/MW-01-04, MW-01-18, MW-01-31.6

Associated QC: None

The current Functional Guidelines for evaluating inorganic data have been applied.

2.1 Validation Flags

The following flags have been applied in red by the data validator and must be considered by the data user.

J, UJ - This flag indicates the result qualified as estimated.

R - This flag indicates an unusable value. The rejected data are known to contain significant errors based on documented information and must not be used by the data user.

Usable - The results that do not carry "J" or "R" are fully usable.
Data

2.2 The Data Assessment

The inorganic data were evaluated based on the following parameters:

- * . Data Completeness
- * . Holding times
- * . Calibration verification results
- * . Blank analysis
- * . Interference check standard results
- * . Matrix spike results
- * . Duplicate analysis results
- * . Field duplicate analysis

- * . Laboratory control sample results
- . Furnace AA results
- . ICP serial dilution results
- * . Detection limit results
- * . Calculation and transcription checks

* - all criteria were met for this parameter.

Validation actions were taken based on the following information:

Calibration Verification

Aqueous analysis only

The CRA standard for Lead was over-recovered at 122.0%. Results near the CRDL may be biased high. Estimate (J2) positive Lead results which are less than 2xCRDL of 6 ug/L. However, as the sample lead results are greater than this level, there is no action.

The CRDL standard for Chromium was over-recovered at 124.2% and 141.2%. Results near the CRDL may be biased high. Estimate (J2) positive Chromium results which are less than 4xCRDL of 40 ug/L. However, as the sample Chromium results are greater than this level, there is no action.

Soil analysis only

The CRA standard for Selenium was over-recovered at 143.4%. Results near the CRDL may be biased high. Estimate (J2) positive Selenium results which are less than 2xCRDL of 2 mg/kg. The 2xCRDL standard for Cadmium was over-recovered at 121.8%. Results near the CRDL may be biased high. Estimate (J2) positive Cadmium results which are less than 4xCRDL of 4 mg/kg. The CRDL standard for Chromium was over-recovered at 126.4% and 122.7%. Results near the CRDL may be biased high. Estimate (J2) positive Chromium results which are less than 4xCRDL of 8 mg/kg. The 2xCRDL standard for Silver was over-recovered at 122.4%. Results near the CRDL may be biased high. Estimate (J2) positive Silver results which are less than 4xCRDL of 8 mg/kg. Based on these levels, the following actions were taken Chromium and Silver in sample MW-01-04 are estimated (J2), Chromium in sample MW-01-18 is estimated (J2) and Silver in sample MW-01-31.6 is estimated (J2).

It should be noted that the low standard of 5 ug/L was used for the Lead analysis, instead of the CRDL of 3 ug/L. As all lead results are greater than 5X the CRDL, there is no action.

Matrix Spike Recoveries

Antimony (28.8%), Lead (153.8%) and Thallium (46.9%) were recovered outside of the control limits in the matrix spike performed on soil sample MW-01-04. Due to a possible low bias, all Antimony and Thallium results are estimated (J5, UJ5). Due to a possible high bias, all positive Lead results are estimated (J5).

It should be noted that the validator did not apply the matrix spike actions to the aqueous QC sample.

In the aqueous analysis batch, a matrix spike was performed on a field rinsate blank sample (except for the cyanide analysis). The affected sample DW-01-101795 was a field sample. However, as it contained high analyte levels, it is qualified based on the lack of pertinent matrix spike data. Therefore, all positive analyte levels less than four times the matrix spike level are estimated (J14).

Blanks

The field blanks contained levels of several metals above the CRDL. The following table lists the maximum concentration of each metal found in the blanks along with the resultant action level. It should be noted that Field rinseate sample RB-SB-101295 was submitted in data package SDG 154204.

Field Blank RB-SB-101295 associated with all soil SDG samples

<u>Element</u>	<u>Maximum Conc./Units</u>	<u>Action Level</u>
Aluminum	317 ug/L, 63.4 mg/kg	317 mg/kg
Iron	409 ug/L, 81.8 mg/kg	409 mg/kg
Zinc	31.4 ug/L, 6.28 mg/kg	31.4 mg/kg

Value < Action Level; the value is rejected R3.

Value > IDL and > Action Level; the value is reported unqualified.

The action level values were compared to the sample value before application of sample dilution factors. Based on the action levels found, there are no qualifications.

It should be noted that in Lead analysis dated 10/30/95, CCB4 was detected at the negative CRDL. No samples in the SDG were affected.

Laboratory Duplicate

In the aqueous analysis batch, a laboratory duplicate was performed on a field rinsate blank sample (except for the cyanide analysis). The affected sample DW-01-101795 was a field sample. However, as it contained high analyte levels, it is qualified based on the lack of pertinent duplicate precision data. Therefore, all results greater than the CRDL are estimated (J15).

Furnace AA Results

Furnace AA QC data were reviewed. Duplicate injections and one-point analytical spikes were performed for each sample and analyte. All duplicate

injections agreed within +/- 20%. Spike recoveries met the 85 - 115% recovery criteria for all samples with the following exception:

<u>Analyte</u>	<u>Sample ID</u>	<u>Recovery</u>	<u>Action</u>
Selenium	DW0110	34.2%	J10, UJ10
Thallium	MW0104	45.6%	J10, UJ10
Thallium	MW0118	50.2%	J10, UJ10
Thallium	MW1316	52.2%	J10, UJ10

ICP Serial Dilution

A serial dilution was performed on soil sample MW-01-04. For initial concentrations greater than 10XIDL, the following %Ds were greater than 10% : Copper (12.8%). As 10XIDL is less than the CRDL, all Copper results greater than the CRDL are estimated (J12).

In the aqueous analysis batch, an ICP serial dilution was performed on a field rinsate blank sample. The affected sample DW-01-101795 was a field sample. However, as it contained high analyte levels, it is qualified based on the lack of pertinent matrix effect data. Therefore, all results greater than the CRDL are estimated (J16).

Detection Limit Results

It should be noted that ICP samples DW-01-101795, MW-01-04, MW-01-18 and MW-01-31.6 were diluted as Iron levels were close to or exceeded the calibration range. The diluted results for all analytes were reported, thus elevating the instrument detection limit (IDL) for all ICP analytes for the samples. A prescan was performed with the samples undiluted. As all undetected levels were below the CRDL for samples MW-01-04, MW-01-18 and MW-01-31.6, no action is taken. Sample DW-01-101795 was analyzed straight, 5x and 10x for ICP and the 10x dilution was reported for all ICP analytes. Antimony, Cadmium and Silver were undetected at 10X, therefore the reported non-detected results were greater than the CRDL. The validator reviewed the interference check sample data (ICSA) and found interference for those elements which would warrant the diluted analysis. No qualification is made.

- 1 - Data has no problems/or qualified due to minor problems.
- 2 - Data qualified due to major problems.
- 3 - Data unacceptable.
- 4 - Problems, but do not affect data.

DATA VALIDATION RECOMMENDATION FOOTNOTES - ORGANICS

- J1, UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and non-detects (UJ1). Holding times have been grossly exceeded: reject all non-detects (R1).
- J2, R2 The initial or continuing calibration RF was low: estimate positive results (J2) and reject non-detects (R2).
- J4, UJ4 The initial calibration %RSD was greater than 30% or the continuing calibration %D was greater than 25%: estimate positive results (J4) and non-detects (UJ4).
- U5 Compound was present in the associated blank. Compound is present in the sample at a concentration less than the CRQL: report the CRQL (U5).
- U6 Compound was present in the associated blank. Compound was present in the sample at a concentration higher than the CRQL but lower than the "action level": qualify the result by reporting the value followed by "U" (U6). (i.e., the limit of detection has been raised for that compound, and the result is considered to be non-detect.
- J7 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was greater than the Contract Required Recovery Range (CRR): estimate positive results within that area of the chromatogram (J7).
- J8, UJ8 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was less than the CRR: estimate positive results (J8) and non-detects (UJ8) within that area of the chromatogram.
- J9, R9 One of more of the surrogate standard % recoveries was less than 10%: estimate positive results (J9) and reject non-detects (R9) within that area of the chromatogram.
- J10 The matrix spike (MS) and/or matrix spike duplicate (MSD) % recoveries were not within the CRR for this compound: estimate positive results in the unspiked sample (J10).
- J11, R11 The MS and/or MSD % recoveries were less than 10% for this compound: estimate positive results in the unspiked sample (J11) and reject non-detects (R11).
- J12 The MS/MSD %RPD for this compound was high: estimate positive results in the unspiked sample (J12).
- J13 Field duplicate %RPD was high for this compound: estimate positive results for this compound in the sample and duplicate (J13).

- J14 One or more of the Internal Standard (IS) areas were detected above the CRR; estimate the positive results for all compounds quantitated from that IS.
- J15, UJ15 One or more of the Internal standard (IS) areas was less than the CRR: estimate positive results (J15) and non-detects (UJ15) for all compounds quantitated from that IS.
- J16, R16 One or more IS areas were grossly low: estimate (J16) positive results and reject (R16) non-detects for all compounds quantitated from that IS.
- J/NJ17, R17 % Breakdown for DDT exceeded 20%: estimate positive results for DDT (J17), DDD, and DDE (NJ17) in all associated samples. If no DDT is present, but DDD and/or DDE are present: reject the CRQL (R6) for DDT. Qualify positive results for DDD and/or DDE as presumptively present at an estimated quantity (NJ17).
- J/NJ18, R18 % Breakdown for endrin exceeded 20%: estimate positive results for endrin (J18). If no endrin is present, but endrin ketone and/or endrin aldehyde are present: reject the CRQL (R7) for endrin. Qualify positive results for endrin aldehyde and endrin ketone (NJ18) as presumptively present at an estimated quantity.
- J/UJ19, R19 Initial calibration %RSD for this compound exceeded 20%: estimate positive and non-detected results (J19, UJ19) for this compound in associated samples. If %RSD exceeded 90%, flag all non-detected results as unusable (R8).
- J/UJ20, R20 Continuing calibration %RPD for this compound exceeded 25% (quantitation or confirmation column): estimate positive and non-detected results (J20, UJ20) for this compound in associated samples. If %RPD exceeded 90%, flag all non-detected results as non-usable (R9).
- J21 Compound reported above calibration range, estimate result (J21).
- J22 The continuing calibration %D exceeded 25% for a surrogate standard compound: estimate (J22) positive results for all compounds associated with the out of control surrogate in the affected samples.
- J23 Surrogate %D >25% or %RSD > 30%, estimate positive results for compounds associated with the out of control surrogate.
- R24 The initial calibration %RSD or continuing calibration %D > 90%. Reject non-detects.
- J/NJ25, R25 Pesticide compound which has concentration values differing from 25 - 50% in its two analyses. Compound result is estimated. Dual column analysis %D is between 50 - 90%; compound result is qualified

as presumptively present at an approximated quantity (NJ25). Dual column %D is greater than 90%; the compound result is rejected (R10).

- R26 Reject non-detected result. Compound detected above the calibration range and could not be quantitated to be reported.
- R27 Isomer identified at the incorrect retention time in samples and/or standards. Reject positive and non-detected results.
- R28 Quality of Spectra submitted poor for compound in question: reject compound result.

DATA VALIDATION RECOMMENDATION FOOTNOTES - INORGANICS

- J/UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and reject non-detects (R1). Samples were improperly preserved prior to analysis; estimate positive results (J1) non-detects (UJ1).
- J/UJ2, R2 Linearity was poor near the CRDL (Low levels). Estimate or reject the results within an affected area based on the recovery of the CRDL standard.
- R3 The analyte was present in the associated blank above the CRDL. The sample result was less than the action level of 5X the maximum concentration found in any blank, and has been rejected. The associated blank had a value below the negative CRDL. Results less than ten times the CRDL are rejected.
- J/UJ4, R4 The ICS recovery of an element is outside of criteria. The reported results or detection limits are estimated or rejected based on the recovery of the interference check sample.
- J/UJ5, R5 The recovery of an element is outside of control limits in the matrix spike. The reported results or detection limits are estimated or rejected based on the recovery.
- J/UJ6 The RPD for laboratory duplicate sample analysis results exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ7 The RPD for the field duplicate analysis exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ8, R8 The LCS recovery for an element is outside of criteria. The reported results are estimated or rejected based on the laboratory control sample analyte recovery.
- J9 The %RSD of duplicate injections for GFAA analysis do not agree within +/- 20%, or the laboratory performed a single burn analysis. The sample results are estimated.
- J10, UJ10 The recovery of analytical spikes for GFAA analysis is outside of control limits. Positive sample results or detection limits are estimated.
- J11 The sample required an MSA which was not performed, was performed incorrectly, or the correlation was < 0.995. The positive results are estimated.
- J12, R12 The results of the ICP Serial Dilution analysis were outside of control limits for initial concentrations equal to or greater than 10XIDL. Analyte results greater than 10XIDL or CRDL are estimated or rejected based on %D.

- J13 The sample was less than 50% solids. Analysis using a method intended for soils might not give representative results. The results are estimated.
- J14 Matrix spike not performed for analysis or performed on field blank. Estimate positive results less than four times the spike level added based on lack of accuracy data.
- J15 Laboratory duplicate not performed for analysis or was performed on a field blank. Estimate positive results greater than the CRDL based on lack of precision data.
- J16 ICP serial dilution was not performed or was performed on field blank. Estimate results greater than 10XIDL or greater than the CRDL for which an ISD was not performed.

CLP DATA ASSESSMENT

Functional Guidelines for Evaluating Organic Analysis

Case No. 155787/816 SDG No. AC787 Laboratory Envirotest Lab. Site Stewart ANG

Data Assessment:

The SDG AC787/155787/816 contains the following samples for analysis:

Volatiles: 12 aqueous/MW-09-1127, MW-01-1128, MW-10-1128, MW-109-1128, MW-108-1128, SW-02-1128, SW-03-1128, MW-13-1128, SW-12-1128, TB-1129, TB-1127, TB-1128

Semi-volatiles: 9 aqueous/MW-09-1127, MW-01-1128, MW-10-1128, MW-109-1128, MW-108-1128, SW-02-1128, SW-03-1128, MW-13-1128, SW-12-1128

Pesticides/PCBs: 9 aqueous/MW-09-1127, MW-01-1128, MW-10-1128, MW-109-1128, MW-108-1128, SW-02-1128, SW-03-1128, MW-13-1128, SW-12-1128

Associated QC: SW-02-1128, SW-12-1128/Field duplicates

The current Functional Guidelines for evaluating organic data have been applied.

All data are valid and acceptable except those analytes which have been qualified with a "J" (estimated), "N" (presumptive evidence for the presence of the material), "U" (non-detects), "R" (unusable), or "JN" (presumptive evidence for the presence of the material at an estimated value). All action detailed on the attached sheets. Spreadsheets containing the validated sample results are found at the end of the report.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant QC problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Data reviewer: GC/MS by Elissa McDonagh Date: 02/13/96

Data reviewer: Pest/PCB by Lorie MacKinnon Date: 02/13/96

Verified By: Lorie MacKinnon Date: 02/13/96

DATA ASSESSMENT

1. HOLDING TIME:

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detects (sample quantitation limits) will be flagged as estimated, "UJ", or "R", if the holding times are grossly exceeded.

The following analytes in the samples shown were qualified because of holding time: The VOA aqueous samples SW031128, MW131128 and TB-1129RE were analyzed one day outside of the required holding time. The VOA aqueous samples SW121128 and SW021128 were analyzed two days outside of the required holding time. It is recommended to estimate the detected and non-detected results (J1, UJ1).

DATA ASSESSMENT

2. BLANK CONTAMINATION:

Quality assurance (QA) blanks, i.e., method, trip, field, or rinse blanks are prepared to identify any contamination which may have been introduced into the samples during the sample preparation or field activity. Method blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. If the concentration of the analyte is less than five times the blank contaminant level (ten times for the common contaminants), the analytes are qualified as non-detects, "U". The following analytes in the samples shown were qualified with "U" for these reasons:

Blank Actions

- Value < CRQL; report CRQL followed by "U" (U5).
- Value > CRQL and < action level; report value followed by "U" (U6).
- Value > CRQL and > action level; report value unqualified.

A. Method blank contamination:

The VOA, ABN and PEST laboratory method blanks and instrument blanks contained the following maximum quantities of contaminants:

Associated samples: All aqueous in SDG

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Naphthalene	2 ug/L	10 ug/L
bis(2-ethylhexyl)phthalate	2 ug/L	20 ug/L
4,4'-DDT	0.011 ug/L	0.055 ug/L

The action level value was compared to the sample values after application of the sample dilution factors and the following actions are recommended: Naphthalene in samples MW1081128, MW091127, MW011128, MW101128 and MW1091128 and bis(2-ethylhexyl)phthalate in samples MW101128, MW1091128, MW131128, SW031128, SW021128 and SW121128 should be reported as the CRQL followed by a "U5". Bis(2-ethylhexyl)phthalate in samples MW1081128 and MW091127 should be reported as the CRQL followed by a "U6" (i.e., the CRQL has been raised and the value is considered to be non-detected).

B. Field or rinse blank contamination ("water blanks" or "distilled water blanks" are validated like any other sample)

It should be noted that there were no field blanks associated with the aqueous samples.

C. Trip blank contamination:

It should be noted that sample TB1129RE appears to have carryover from the

Attachment 1, SOP No. HW-6
SDG No: AC787/155787/155816

Page 5

standard analyzed in the cell prior to the sample. Both initial and re-analysis are included in the package. The compounds detected in the re-analysis were not used to qualify the data.

DATA ASSESSMENT

3. MASS SPECTROMETER TUNING:

Tuning performance criteria are established to ensure adequate mass resolution, proper identification of compounds, and to some degree, sufficient instrument sensitivity. These criteria are not sample specific. Instrument performance is determined using standard materials. Therefore, these criteria should be met in all circumstances. The tuning standard for volatile organics is bromofluorobenzene (BFB) and for semi-volatiles is decafluorotriphenyl-phosphine (DFTPP).

If the mass calibration is in error, or missing, all associated data will be classified as unusable, "R". The following samples shown were qualified with "R" because of tuning: All tuning criteria were met.

DATA ASSESSMENT

4. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of giving acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument is giving satisfactory daily performance.

A. RESPONSE FACTOR

The response factor measures the instrument's response to specific chemical compounds. The response factor for the VOA/ABN Target Compound List (TCL) must be ≥ 0.05 in both the initial and continuing calibrations. A value < 0.05 indicates a serious detection and quantitation problem (poor sensitivity). If the mean RRF of the initial calibration or the continuing calibration has a response factor < 0.05 for any analyte, those analytes detected in environmental samples will be qualified as estimated, "J". All nondetects for those compounds will be rejected, "R". The following analytes in the samples shown were qualified because of response factor:

VOA instrument "MSD2", initial calibration 12/01/95:

<u>COMPOUND</u>	<u>IC</u> <u>(12/1/95)</u>	<u>CC</u> <u>(12/4/95)</u>
Acetone		+
Associated samples:	All listed	MW091127, TB-1127 TB-1128

VOA instrument "MSD2", initial calibration 12/05/95:

<u>COMPOUND</u>	<u>IC</u> <u>(12/5/95)</u>	<u>CC</u> <u>(12/05/95)</u>	<u>CC</u> <u>(12/06/95)</u>	<u>CC</u> <u>(12/07/95)</u>
Acetone	+	+	+	+
4-Methyl-2-Pentanone	+	+	+	+
2-Hexanone	+	+	+	+
Associated samples:	All listed	MW1081128 MW011128 MW101128 MW1091128	SW031128 MW131128 SW121128 TB-1129	SW021128 TB-1129RE

+ - RF < 0.05 ; Estimate positive results (J2) and reject non-detects (R2) in the associated samples.

DATA ASSESSMENT

5. CALIBRATION

A. PERCENT RELATIVE STANDARD DEVIATION (%RSD) AND PERCENT DIFFERENCE (%D):

Percent RSD is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent D compares the response factor of the continuing calibration check to the mean response factor (RRF) from the initial calibration. Percent D is a measure of the instrument's daily performance. Percent RSD must be < 30% and the %D must be < 25%. A value outside of these limits indicates potential detection and quantitation errors. For these reasons, all positive results are flagged as estimated, "J"; and non-detects are flagged "UJ". If the %RSD and %D grossly exceed QC criteria, non-detect data may be qualified "R".

For the PCB/PESTICIDE fraction, if %RSD of the initial calibration exceeds 20% for all analytes except to the two surrogates (which must not exceed 30% RSD), qualify all associated positive results "J" and non-detects "UJ". If the %RPD of the continuing calibration check is greater than 25%, positive and non-detected results are estimated "J, UJ".

The following analytes in the samples shown were qualified for %RSD, %D or %RPD:

VOA instrument "MSD2", initial calibration 12/01/95:

<u>COMPOUND</u>	<u>IC</u> <u>(12/1/95)</u>	<u>CC</u> <u>(12/4/95)</u>
Bromomethane	X	X
Chloromethane	X	
Acetone		X
4-methyl-2-pentanone		X
2-Hexanone		X
Associated samples:	All listed	MW091127, TB-1127 TB-1128

VOA instrument "MSD2", initial calibration 12/05/95:

<u>COMPOUND</u>	<u>IC</u> <u>(12/5/95)</u>	<u>CC</u> <u>(12/05/95)</u>	<u>CC</u> <u>(12/06/95)</u>	<u>CC</u> <u>(12/07/95)</u>
Bromomethane				X
Vinyl Chloride				X
m,p-xylene			X	X
Associated samples:	All listed	MW1081128 MW011128 MW101128	SW031128 MW131128 SW121128	SW021128 TB-1129RE

MW1091128 TB-1129

ABN instrument "5972-2", initial calibration 11/29/95:

<u>COMPOUND</u>	<u>IC</u> <u>(11/29/95)</u>	<u>CC</u> <u>(12/07/95)</u>
3-Nitroaniline		X
Associated samples:	All listed	SW031128, MW131128, SW021128, SW121128

X - %RSD > 30% or %D > 25%; Estimate (J4) positive and non-detected (UJ4) results in the associated samples.

Pesticide Initial Calibration

<u>Compound</u>	<u>Date</u>	<u>%RPD</u>	<u>Column</u>	<u>Associated Samples</u>
beta-BHC	12/14/95	20.4%	DB-5	All samples

It is recommended to estimate all non-detected and detected (quantitated on the DB-5 column) results (UJ19, J19) for all SDG samples.

Analysis of the PEST Resolution Check Mixture yielded a 54% resolution between 4,4'-DDE and Dieldrin on the DB-05 column. It is recommended to estimate (J29) positive 4,4'-DDE and Dieldrin results quantitated off the DB-05 column. It is also recommended to estimate the non-detected Dieldrin results (UJ29) in the samples where 4,4'-DDE is detected. It should be noted that the data package narrative incorrectly reported the resolution problem with the compounds gamma-chlordane and 4,4'-DDE.

Pesticide Continuing Calibration

<u>Compound</u>	<u>Standard/Time</u>	<u>%RPD</u>	<u>Column</u>	<u>Associated Samples</u>
beta-BHC	PEM01 12/14 17:31	30.0%	DB-5	All samples
beta-BHC	PEM02 12/15 02:12	40.0%	DB-5	All samples
Endrin	PEM02 12/15 02:12	26.0%	DB-5	All samples
4,4'-DDT	PEM02 12/15 02:12	27.0%	DB-5	All samples

Therefore, all non-detected and detected compound results (quantitated off the DB-5 column) are estimated (J20, UJ20).

DATA ASSESSMENT

6. SURROGATES/SYSTEM MONITORING COMPOUNDS (SMC):

All samples are spiked with surrogate/SMC compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. If the measured surrogate/SMC concentrations were outside contract specifications, qualifications were applied to the samples and analytes as shown below. The following analytes for the samples shown were qualified because of surrogate/SMC recovery:

The VOA surrogate Toluene-d8 was over-recovered in the aqueous sample TB-1129. The sample was re-analyzed as is required. No action is recommended.

The ABN surrogate Terphenyl-d14 was under-recovered in the aqueous samples MW011128, MW091127 and MW101128. The ABN surrogates 2-Fluorobiphenyl and 2-Chlorophenol-d4 were under-recovered in the aqueous sample SW031128. No action is required.

The PEST surrogates TCX and DCB were under-recovered (TCX, 36% and 55%, DCB 55%) in sample SW-03-1128. It is recommended to estimate positive and non-detected results (J8, UJ8) for that sample.

DATA ASSESSMENT

7. INTERNAL STANDARDS PERFORMANCE:

Internal Standard (IS) performance criteria ensure that the GC/MS sensitivity and response are stable during every experimental run. The internal standard area count must not vary by more than a factor of two (-50% to +100%) from the associated continuing calibration standard. The retention time of the internal standard must not vary by more than +/-30 seconds from the associated continuing calibration standard. If the area count is outside the (-50% to +100%) range of the associated standard, all of the positive results for compounds quantitated using that IS are qualified as estimated "J", and all non-detects as "UJ" only if IS area is <50%. Non-detects are qualified as "R" if there is a severe loss of sensitivity (<25% of the associated area counts).

If an internal standard retention time varies by more than 30 seconds, the reviewer will use professional judgment to determine either partial or total rejection of the data for that sample fraction. The following analytes in the samples shown were qualified because of internal standards performance: All internal standard criteria were met.

DATA ASSESSMENT

8. COMPOUND IDENTIFICATION:

A. VOLATILE AND SEMI-VOLATILE FRACTIONS

TCL compounds are identified on the GC/MS by using the analyte's relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within +/- 0.06 RRT units of the standard compound, and have an ion spectra which has a ratio of the primary and secondary m/e intensities within 20% of that in the standard compound. For tentatively identified compounds (TIC), the ion spectra must match accurately. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications. The following analytes in the samples shown were qualified for compound identification: No compounds were qualified due to compound identification.

B. PESTICIDE FRACTIONS

The retention times of reported compounds must fall within the calculated retention time windows for the two chromatographic columns. The percent difference (%D) of the positive results obtained on the two GC columns should be <= 25%. The following analytes in the samples shown were qualified because of compound identification:

It should be noted that 4, 4'-DDD had a %D >90% in most samples and was rejected. Upon review of the sample chromatograms, it appears that there is a interferant peak present which is slightly resolved on the DB-05 column. The laboratory is able to integrate and report the peaks separately, although due to the compression of the chromatogram, the validator was not able to check the accuracy of the integration. On the DB-17 column, however, it appears that the 4,4'-DDD and interferant peak co-elute and the two compounds are reported as 4,4'-DDD. Due to the discrepancy, the %D is high. The results with high %D are rejected as the validator is unable to confirm which of the two peaks (in the DB-5 chromatograms) is 4,4'-DDD.

MW108-1128 4,4'-DDD (214.8%, R25)

MW09-1127 4,4'-DDD (138.1%, R25)

MW01-1128 4,4'-DDD (141.2%, R25)
4,4'-DDT (41.9%, J25)

MW01-1128DL 4,4'-DDE (66.7%, JN25)
4,4'-DDD (230.8%, R25)

MW10-1128 4,4'-DDD (147.2%, R25)

MW109-1128 4,4'-DDD (376.9%, R25)

SW03-1128 4,4'-DDD (225.0%, R25)
4,4'-DDT (52.5%, JN25)

SW03-1128DL 4,4'-DDE (120.3%, R25)
4,4'-DDD (300.0%, R25)

MW13-1128 4,4'-DDD (71.0%, JN25)

SW02-1128 4,4'-DDD (833.3%, R25)
4,4'-DDT (42.9%, J25)
alpha-chlordane (205.9%, R25)

SW02-1128DL 4,4'-DDD (226.1%, R25)
4,4'-DDE (35.1%, J25)

SW12-1128 4,4'-DDD (1366.7%, R25)
4,4'-DDT (30.0%, J25)
Endrin (990.9%, R25)

SW12-1128DL 4,4'-DDD (167.6%, R25)
4,4'-DDE (33.8%, J25)

DATA ASSESSMENT

9. MATRIX SPIKE/SPIKE DUPLICATE, MS/MSD:

The MS/MSD data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD may be used in conjunction with other QC criteria for some additional qualification of data. The following analytes, for the samples shown, were qualified because of the MS/MSD:

4,4'-DDT (36%) was recovered outside of the QC limits in the matrix spike duplicate performed on PEST fraction sample MW-09-1127. It is recommended to estimate (J10) the 4,4'-DDT result in the sample. The %RPD for Dieldrin was high (21%) in the PEST MS/MSD pair. As Dieldrin was not detected in the native sample, there is no action.

DATA ASSESSMENT

10. OTHER QC DATA OUT OF SPECIFICATION:

VOLATILES: It should be noted that the laboratory reference spectra for Acetone was of poor quality. It should be noted that the laboratory reference spectra for 2-Butanone was of poor quality. The m/z ion 58 was used to quantitate acetone (the SOP requests the 43 ion to be used for quantitation).

The Tentatively Identified Compound forms (1E and 1F) did not include the "JN" qualifier.

The response factors are not shown on the quantitation reports.

The spectra for the detected Phenol in samples MW1091128, SW021128 and SW121128 should have been cleaned before reported.

The spectra for the detected 2-Butanone in sample MW091127 should have been cleaned before reported.

It should be noted that the %RPD for ABN compounds Naphthalene and 2-Methylnaphthalene was greater than 30% in the field duplicate pair SW-02-1128 and SW-12-1128. It is recommended to estimate (J13) the detected results for those compounds in the sample and field duplicate.

It should be noted that the %RPD for 4,4'-DDT was high (58.5%) in the field duplicate pair SW-02-1128 and SW-12-1128. It is recommended to estimate (J13) 4,4'-DDT in the sample and duplicate.

11. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT: Overall system performance was good.

12. CONTRACTUAL NON-COMPLIANCE: None

13. This package contains re-extraction, re-analysis or dilution. Upon reviewing the QC results, the following form I(s) and/or compounds are identified to be used:

Volatiles:

TB-1129, TB-1129RE

Use the positive and non-detected results from the original analysis

Pesticides:

MW-01-1128, MW-01-1128DL

Use 4,4'-DDD (rejected) and 4,4'-DDT result from diluted analysis.
Use all other detected and non-detected results from the original analysis.

SW-03-1128, SW-03-1128DL

Use 4,4'-DDD (rejected) and 4,4'-DDT result from diluted analysis.
Use all other detected and non-detected results from the original analysis.

SW-02-1128, SW-02-1128DL

Use 4,4'-DDD (rejected) and 4,4'-DDT result from diluted analysis.
Use all other detected and non-detected results from the original analysis.

SW-12-1128, SW-12-1128DL

Use 4,4'-DDD (rejected) and 4,4'-DDT result from diluted analysis.
Use all other detected and non-detected results from the original analysis.

XX - Multiple TICs of this description were found in this sample.

Rejected Tentatively Identified Compounds are not included in this table.

CLP DATA ASSESSMENT

Appendix A.2: Data Assessment Narrative

Case No. 155787/816 SDG No. ANE787/ANE816 Laboratory Envirotest Lab.

Site Stewart ANG Contractor Aneptek Reviewer Lorie MacKinnon

Matrix: 18 aqueous

Data Assessment:

The SDG ANE787/ANE816 contains the following samples for analysis:

Metals/CN: ANE787 10 aqueous/TMW-09-1127, TMW-01-1128, TMW-10-1128, TMW-109-1128, TMW-108-1128, DMW-09-1127, DMW-01-1128, DMW-10-1128, DMW-109-1128, DMW-108-1128

ANE816 8 aqueous/TSW-02-1128, TSW-03-1128, TMW-13-1128, TSW-12-1128, DSW-02-1128, DSW-03-1128, DMW-13-1128, DSW-12-1128

Associated QC: TSW-02-1128, TSW-12-1128, DSW-02-1128, DSW-12-1128/Field duplicates

It should be noted that the validator assigned the samples for Total metals analysis the "T" prefix and the samples for dissolved metals analysis the "D" prefix.

The current Functional Guidelines for evaluating inorganic data have been applied.

2.1 Validation Flags

The following flags have been applied in red by the data validator and must be considered by the data user.

J, UJ - This flag indicates the result qualified as estimated.

R - This flag indicates an unusable value. The rejected data are known to contain significant errors based on documented information and must not be used by the data user.

Usable - The results that do not carry "J" or "R" are fully usable.
Data

2.2 The Data Assessment

The inorganic data were evaluated based on the following parameters:

- * • Data Completeness
- * • Holding times
- Calibration verification results
- * • Blank analysis
- * • Interference check standard results
- Matrix spike results
- Duplicate analysis results
- Field duplicate analysis
- * • Laboratory control sample results
- Furnace AA results
- ICP serial dilution results
- * • Detection limit results
- Calculation and transcription checks

* - all criteria were met for this parameter.

Validation actions were taken based on the following information:

Calibration Verification

ANE 787

The CRDL standard for Silver was over-recovered at 123.7%. Results near the CRDL may be biased high. Estimate (J2) positive Silver results which are less than 4xCRDL of 40 ug/L. Based on this action level, the Silver result for sample TMW09-1127 is estimated.

ANE 816

The CRDL standard for Silver was over-recovered at 121.4%. Results near the CRDL may be biased high. Estimate (J2) positive Silver results which are less than 4xCRDL of 40 ug/L. Based on this action level, the detected Silver results for all samples in ANE816 are estimated.

The 2xCRDL standard for Chromium was under-recovered at 75.5%. Results near the CRDL may be biased low. Estimate positive and non-detected (J2, UJ2) Chromium results which are less than 4xCRDL of 40 ug/L. Based on this action level, the Chromium results for all samples in ANE816 are estimated.

It should be noted that the low standard of 5 ug/L was used for the Lead analysis, instead of the CRDL of 3 ug/L. As the lead CRA standard recovery was within control limits, there is no action.

Blanks

It should be noted that in the ANE787 data report, the vanadium blanks were incorrectly reported on the Form 3s. The validator edited the forms. In the ANE 816 data report, the Form 3 lists the continuing blank CCB6 for Lead at 6.2 ug/L. The validator reviewed the raw data and found that the blank in question was detected below the CRDL at 0.3 ug/L. The validator edited the Form 3.

Matrix Spike Recoveries

ANE 787

Selenium (71.4%) and Zinc (54.2%) were recovered outside of the control limits in the matrix spike performed on total metals sample TMW-09-1127. Due to a possible low bias, all Selenium and Zinc results are estimated (J5, UJ5) for total metals samples in the SDG. Zinc (53.7%) was recovered outside of the control limits in the matrix spike performed on dissolved metals sample DMW-09-1127. Due to a possible low bias, all Zinc results are estimated (J5, UJ5) for dissolved metals samples in the SDG.

ANE 816

Selenium (50.8%), Thallium (58.0%) and Zinc (53.0%) were recovered outside of the control limits in the matrix spike performed on total metals sample TSW-03-1128. Due to a possible low bias, all Selenium, Thallium and Zinc results are estimated (J5, UJ5) for all metals samples in the SDG.

Laboratory Duplicate Analysis

ANE787

Laboratory duplicates were performed for both total and dissolved samples. The %RPD for Zinc (78.7%) in the laboratory duplicate analysis performed on DMW-09-1127 was outside of control limits. It is recommended to estimate (J6) zinc results for the dissolved metals samples.

It should be noted that the vanadium laboratory duplicates were incorrectly reported on the Form 6. The duplicate values were within the CRDL, therefore not requiring the "*" qualifier. The validator removed the "*" qualifier from the Form I's of the associated samples.

ANE816

A laboratory duplicate was performed on sample TSW031128 to be associated with all SDG ANE816 samples. The %RPD for Zinc (72.1%) in the laboratory duplicate analysis performed on TSW-03-1128 was outside of control limits. It is recommended to estimate (J6) zinc results for all SDG samples.

Field Duplicates

The %RPD for Zinc (66.9%) in the field duplicate pair of TSW-02-1128 and TSW-12-1128 was outside of control limits. It is recommended to estimate (J7) all Zinc results for the total metals analysis samples. The %RPD for Zinc (119.1%) in the field duplicate pair of DSW-02-1128 and DSW-12-1128 was outside of control limits. It is recommended to estimate (J7) all Zinc results for the dissolved metals analysis samples.

Furnace AA Results

Furnace AA QC data were reviewed. Duplicate injections and one-point analytical spikes were performed for each sample and analyte. All duplicate injections agreed within +/- 20%. Spike recoveries met the 85 - 115% recovery criteria for all samples with the following exceptions:

ANE787

<u>Analyte</u>	<u>Sample ID</u>	<u>Recovery</u>	<u>Action</u>
Selenium	TMW-01-1128	83.3%	J10, UJ10
Thallium	TMW-01-1128	130.5%	U, No Action
Thallium	TMW-10-1128	117.5%	U, No Action
Thallium	TMW-109-1128	125.1%	U, No Action
Thallium	DMW-108-1128	124.9%	U, No Action

ANE816

<u>Analyte</u>	<u>Sample ID</u>	<u>Recovery</u>	<u>Action</u>
Arsenic	DSW-02-1128	119.1%	U, No Action
Selenium	TSW-03-1128	52.2%	J10, UJ10
Selenium	TMW-13-1128	81.4%	J10, UJ10
Selenium	TSW-02-1128	69.1%	J10, UJ10
Selenium	TSW-12-1128	67.5%	J10, UJ10
Selenium	DSW-03-1128	68.6%	J10, UJ10
Selenium	DSW-12-1128	59.1%	J10, UJ10
Selenium	DSW-02-1128	63.0%	J10, UJ10
Thallium	TMW-13-1128	128.4%	U, No Action
Thallium	DMW-13-1128	144.7%	U, No Action

It should be noted that the "W" qualifier was not present for Selenium on the Form I for sample DSW-02-1128. The validator edited the Form I. It should be noted that in the Form 14 for the Lead analysis dated 12/14/95, an analytical spike was not listed in the run for sample TSW-03-1128. The validator reviewed the raw data and found the analytical spike to be present and within control limits. The Form 14 was edited.

ICP Serial Dilution

ANE787

A serial dilution was performed on sample TMW-09-1127. For initial concentrations greater than 10XIDL, the following %Ds were greater than 10% : Potassium (10.3%). As 10XIDL was less than the CRDL, all Potassium results in SDG 787, greater than the CRDL, are estimated (J12).

ANE816

A serial dilution was performed on sample TSW-03-1128. For initial concentrations greater than 10XIDL, the following %Ds were greater than 10% : Barium (37.6%), Copper (72.4%), Potassium (21.9%) and Vanadium (15.3%). As 10XIDL was less than the CRDL in all cases, all Barium, Copper, Potassium and Vanadium results in SDG 816, greater than the CRDL are estimated (J12).

Total and Dissolved Metals comparison

A comparison of the total and dissolved metals results was performed. If the concentration of any dissolved analyte was greater than its total concentration by more than 10%, both were estimated (J17). If the concentration of any dissolved analyte was greater than its total concentration by more than 50%, both were rejected (R17). The following table lists the analytes out of control limits in the sample pairs.

<u>Sample Pair</u>	<u>Analyte</u>	<u>%Greater</u>	<u>Action</u>
TMW108-1128/DMW108-1128	Zinc	43.5%	J17
TMW-01-1128/DMW-01-1128	Zinc	29.8%	J17
TMW-09-1127/DMW-09-1127	Zinc	11.7%	J17
TMW109-1128/DMW109-1128	Manganese	22.8%	J17
	Sodium	10.2%	J17
TSW-12-1128/DSW-12-1128	Zinc	53.0%	R17

Calculation and Transcription Check

A transcription error was found in the Lead results for samples TMW109-1129 and DMW108-1128. Both are undetected, but are reported down to the wrong instrument detection limit. The Form I's were edited. A transcription error was found in the Mercury result for sample TMW-09-1127. The reported result was undetected 0.20 U. However, upon review of the raw data, the validator found that the sample result was detected at 0.23 ug/L. The Form I was edited.

CLP DATA ASSESSMENT

Appendix A.4: CLP Data Assessment Result Forms:

Spreadsheets containing the validated sample results are found at the end of the report.

- 1 - Data has no problems/or qualified due to minor problems.
- 2 - Data qualified due to major problems.
- 3 - Data unacceptable.
- 4 - Problems, but do not affect data.

DATA VALIDATION RECOMMENDATION FOOTNOTES - ORGANICS

- J1, UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and non-detects (UJ1). Holding times have been grossly exceeded: reject all non-detects (R1).
- J2, R2 The initial or continuing calibration RF was low: estimate positive results (J2) and reject non-detects (R2).
- J4, UJ4 The initial calibration %RSD was greater than 30% or the continuing calibration %D was greater than 25%: estimate positive results (J4) and non-detects (UJ4).
- U5 Compound was present in the associated blank. Compound is present in the sample at a concentration less than the CRQL: report the CRQL (U5).
- U6 Compound was present in the associated blank. Compound was present in the sample at a concentration higher than the CRQL but lower than the "action level": qualify the result by reporting the value followed by "U" (U6). (i.e., the limit of detection has been raised for that compound, and the result is considered to be non-detect..
- J7 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was greater than the Contract Required Recovery Range (CRR): estimate positive results within that area of the chromatogram (J7).
- J8, UJ8 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was less than the CRR: estimate positive results (J8) and non-detects (UJ8) within that area of the chromatogram.
- J9, R9 One of more of the surrogate standard % recoveries was less than 10%: estimate positive results (J9) and reject non-detects (R9) within that area of the chromatogram.
- J10 The matrix spike (MS) and/or matrix spike duplicate (MSD) % recoveries were not within the CRR for this compound: estimate positive results in the unspiked sample (J10).
- J11, R11 The MS and/or MSD % recoveries were less than 10% for this compound: estimate positive results in the unspiked sample (J11) and reject non-detects (R11).
- J12 The MS/MSD %RPD for this compound was high: estimate positive results in the unspiked sample (J12).
- J13 Field duplicate %RPD was high for this compound: estimate positive results for this compound in the sample and duplicate (J13).

- J14 One or more of the Internal Standard (IS) areas were detected above the CRR; estimate the positive results for all compounds quantitated from that IS.
- J15, UJ15 One or more of the Internal standard (IS) areas was less than the CRR: estimate positive results (J15) and non-detects (UJ15) for all compounds quantitated from that IS.
- J16, R16 One or more IS areas were grossly low: estimate (J16) positive results and reject (R16) non-detects for all compounds quantitated from that IS.
- J/NJ17, R17 % Breakdown for DDT exceeded 20%: estimate positive results for DDT (J17), DDD, and DDE (NJ17) in all associated samples. If no DDT is present, but DDD and/or DDE are present: reject the CRQL (R6) for DDT. Qualify positive results for DDD and/or DDE as presumptively present at an estimated quantity (NJ17).
- J/NJ18, R18 % Breakdown for endrin exceeded 20%: estimate positive results for endrin (J18). If no endrin is present, but endrin ketone and/or endrin aldehyde are present: reject the CRQL (R7) for endrin. Qualify positive results for endrin aldehyde and endrin ketone (NJ18) as presumptively present at an estimated quantity.
- J/UJ19, R19 Initial calibration %RSD for this compound exceeded 20%: estimate positive and non-detected results (J19, UJ19) for this compound in associated samples. If %RSD exceeded 90%, flag all non-detected results as unusable (R8).
- J/UJ20, R20 Continuing calibration %RPD for this compound exceeded 25% (quantitation or confirmation column): estimate positive and non-detected results (J20, UJ20) for this compound in associated samples. If %RPD exceeded 90%, flag all non-detected results as non-usable (R9).
- J21 Compound reported above calibration range, estimate result (J21).
- J22 The continuing calibration %D exceeded 25% for a surrogate standard compound: estimate (J22) positive results for all compounds associated with the out of control surrogate in the affected samples.
- J23 Surrogate %D >25% or %RSD > 30%, estimate positive results for compounds associated with the out of control surrogate.
- R24 The initial calibration %RSD or continuing calibration %D > 90%. Reject non-detects.
- J/NJ25, R25 Pesticide compound which has concentration values differing from 25 - 50% in its two analyses. Compound result is estimated. Dual column analysis %D is between 50 - 90%; compound result is qualified

as presumptively present at an approximated quantity (NJ25). Dual column %D is greater than 90%; the compound result is rejected (R10).

- R26 Reject non-detected result. Compound detected above the calibration range and could not be quantitated to be reported.
- R27 Isomer identified at the incorrect retention time in samples and/or standards. Reject positive and non-detected results.
- R28 Quality of Spectra submitted poor for compound in question: reject compound result.

DATA VALIDATION RECOMMENDATION FOOTNOTES - INORGANICS

- J/UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and reject non-detects (R1). Samples were improperly preserved prior to analysis; estimate positive results (J1) non-detects (UJ1).
- J/UJ2, R2 Linearity was poor near the CRDL (Low levels). Estimate or reject the results within an affected area based on the recovery of the CRDL standard.
- R3 The analyte was present in the associated blank above the CRDL. The sample result was less than the action level of 5X the maximum concentration found in any blank, and has been rejected. The associated blank had a value below the negative CRDL. Results less than ten times the CRDL are rejected.
- J/UJ4, R4 The ICS recovery of an element is outside of criteria. The reported results or detection limits are estimated or rejected based on the recovery of the interference check sample.
- J/UJ5, R5 The recovery of an element is outside of control limits in the matrix spike. The reported results or detection limits are estimated or rejected based on the recovery.
- J/UJ6 The RPD for laboratory duplicate sample analysis results exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ7 The RPD for the field duplicate analysis exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ8, R8 The LCS recovery for an element is outside of criteria. The reported results are estimated or rejected based on the laboratory control sample analyte recovery.
- J9 The %RSD of duplicate injections for GFAA analysis do not agree within +/- 20%, or the laboratory performed a single burn analysis. The sample results are estimated.
- J10, UJ10 The recovery of analytical spikes for GFAA analysis is outside of control limits. Positive sample results or detection limits are estimated.
- J11 The sample required an MSA which was not performed, was performed incorrectly, or the correlation was < 0.995. The positive results are estimated.
- J12, R12 The results of the ICP Serial Dilution analysis were outside of control limits for initial concentrations equal to or greater than 10XIDL. Analyte results greater than 10XIDL or CRDL are estimated or rejected based on %D.

- J13 The sample was less than 50% solids. Analysis using a method intended for soils might not give representative results. The results are estimated.
- J14 Matrix spike not performed for analysis or performed on a field blank. Estimate positive results less than four times the spike level added based on lack of accuracy data.
- J15 Laboratory duplicate not performed for analysis or was performed on field blank. Estimate positive results greater than the CRDL based on lack of precision data.
- J16 ICP serial dilution was not performed or was performed on field blank. Estimate results greater than 10XIDL or greater than the CRDL for which an ISD was not performed.
- J17, R17 A comparison of the total and dissolved analytes was performed. If the concentration of any dissolved analyte was greater than its total concentration by more than 10% both were estimated. If the concentration of any dissolved analyte was greater than its total concentration by more than 50% both were rejected.

CLP DATA ASSESSMENT

Functional Guidelines for Evaluating Organic Analysis

Case No. 154598/678 SDG No. 598/678 Laboratory Envirotest Lab. Site Stewart ANG

Data Assessment:

The SDG 154598/678 contains the following samples for analysis:

Volatiles: 4 soil/MW-02-17, MW-02-31, MW-03-22, MW-03-32
2/aqueous/TRIP BLK01, TRIP BLK02

Semi-volatiles: 4 soil/MW-02-17, MW-02-31, MW-03-22, MW-03-32

Pesticides/PCBs: 4 soil/MW-02-17, MW-02-31, MW-03-22, MW-03-32

The current Functional Guidelines for evaluating organic data have been applied.

All data are valid and acceptable except those analytes which have been qualified with a "J" (estimated), "N" (presumptive evidence for the presence of the material), "U" (non-detects), "R" (unusable), or "JN" (presumptive evidence for the presence of the material at an estimated value). All action detailed on the attached sheets. Spreadsheets containing the validated sample results are found at the end of the report.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant QC problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Data reviewer: GC/MS by Elissa McDonagh Date: 03/05/96

Data reviewer: Pest/PCB by Lorie MacKinnon Date: 03/05/96

Verified By: Lorie MacKinnon Date: 03/05/96

DATA ASSESSMENT

1. HOLDING TIME:

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detects (sample quantitation limits) will be flagged as estimated, "UJ", or "R", if the holding times are grossly exceeded.

The following analytes in the samples shown were qualified because of holding time: All samples were extracted and analyzed within the required holding times.

DATA ASSESSMENT

2. BLANK CONTAMINATION:

Quality assurance (QA) blanks, i.e., method, trip, field, or rinse blanks are prepared to identify any contamination which may have been introduced into the samples during the sample preparation or field activity. Method blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. If the concentration of the analyte is less than five times the blank contaminant level (ten times for the common contaminants), the analytes are qualified as non-detects, "U". The following analytes in the samples shown were qualified with "U" for these reasons:

Blank Actions

- Value < CRQL; report CRQL followed by "U" (U5).
- Value > CRQL and < action level; report value followed by "U" (U6).
- Value > CRQL and > action level; report value unqualified.

A. Method blank contamination:

The VOA, ABN and PEST laboratory method blanks and instrument blanks contained the following maximum quantities of contaminants:

PEST BLK03 - Associated samples: MW-02-17 and MW-02-31

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Heptachlor	0.30 ug/kg	1.5 ug/kg

PEST BLK04 - Associated samples: . MW-03-22 and MW-03-32

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Heptachlor	0.37 ug/kg	1.85 ug/kg
4,4'-DDD	1.2 ug/kg	6.0 ug/kg
4,4'-DDT	2.0 ug/kg	10 ug/kg

Associated samples: All SEMI and VOA samples in SDG

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
Methylene Chloride	2 ug/kg	20 ug/kg
Acetone	17 ug/kg	170 ug/kg
Xylenes	1 ug/kg	5 ug/kg
di-n-butyl phthalate	44 ug/kg	440 ug/kg

The action level value was compared to the sample values after application of the sample dilution factors and the following actions are recommended: Methylene Chloride in samples MW-02-17 and MW-03-22, Acetone in samples MW-03-22

and MW-03-32, Xylenes in samples MW-02-17, MW-02-31 and MW-03-32, di-n-butyl phthalate in samples MW-02-17, MW-02-31, MW-03-22 and MW-03-32 and Heptachlor in samples MW-03-22, MW-03-32 and MW-02-31 should be reported as the CRQL followed by a "U5". Acetone in samples MW-02-17 and MW-02-31 and 4,4'-DDD and 4,4'-DDT in sample MW-03-32 should be reported as the CRQL followed by a "U6"(i.e., the CRQL has been raised and the value is considered to be non-detected).

B. Field or rinse blank contamination ("water blanks" or "distilled water blanks " are validated like any other sample)

It should be noted that there are no field or rinse blanks associated with the samples in the SDG.

C. Trip blank contamination:

No compounds were detected.

DATA ASSESSMENT

3. MASS SPECTROMETER TUNING:

Tuning performance criteria are established to ensure adequate mass resolution, proper identification of compounds, and to some degree, sufficient instrument sensitivity. These criteria are not sample specific. Instrument performance is determined using standard materials. Therefore, these criteria should be met in all circumstances. The tuning standard for volatile organics is bromofluorobenzene (BFB) and for semi-volatiles is decafluorotriphenyl-phosphine (DFTPP).

If the mass calibration is in error, or missing, all associated data will be classified as unusable, "R". The following samples shown were qualified with "R" because of tuning: All tuning criteria were met.

DATA ASSESSMENT

4. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of giving acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument is giving satisfactory daily performance.

A. RESPONSE FACTOR

The response factor measures the instrument's response to specific chemical compounds. The response factor for the VOA/ABN Target Compound List (TCL) must be ≥ 0.05 in both the initial and continuing calibrations. A value < 0.05 indicates a serious detection and quantitation problem (poor sensitivity). If the mean RRF of the initial calibration or the continuing calibration has a response factor < 0.05 for any analyte, those analytes detected in environmental samples will be qualified as estimated, "J". All nondetects for those compounds will be rejected, "R". The following analytes in the samples shown were qualified because of response factor:

ABN instrument "5972-1", initial calibration 10/04/95:

<u>COMPOUND</u>	<u>IC</u> <u>(10/04/95)</u>	<u>CC</u> <u>(11/02/95)</u>	<u>CC</u> <u>(11/08/95)</u>
3-Nitroaniline		+	
4-Nitrophenol			+
Associated samples:	All listed	MW-02-17 MW-02-31	MW-02-17DL MW-03-22 MW-03-32

+ - RF < 0.05 ; Estimate positive results (J2) and reject non-detects (R2) in the associated samples.

DATA ASSESSMENT

5. CALIBRATION

A. PERCENT RELATIVE STANDARD DEVIATION (%RSD) AND PERCENT DIFFERENCE (%D):

Percent RSD is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent D compares the response factor of the continuing calibration check to the mean response factor (RRF) from the initial calibration. Percent D is a measure of the instrument's daily performance. Percent RSD must be < 30% and the %D must be < 25%. A value outside of these limits indicates potential detection and quantitation errors. For these reasons, all positive results are flagged as estimated, "J"; and non-detects are flagged "UJ". If the %RSD and %D grossly exceed QC criteria, non-detect data may be qualified "R".

For the PCB/PESTICIDE fraction, if %RSD exceeds 20% for all analytes except to the two surrogates (which must not exceed 30% RSD), qualify all associated positive results "J" and non-detects "UJ". If the %RPD of the continuing calibration check is greater than 25%, positive and non-detected results are estimated "J, UJ".

The following analytes in the samples shown were qualified for %RSD, %D or %RPD:

ABN instrument "5972-1", initial calibration 10/04/95:

<u>COMPOUND</u>	<u>IC</u> <u>(10/04/95)</u>	<u>CC</u> <u>(11/02/95)</u>	<u>CC</u> <u>(11/08/95)</u>
2,2'-oxybis- (1-chloropropane)			X
4-Chloroaniline		X	X
Hexachlorocyclopentadiene			X
2-Nitroaniline		X	X
3-Nitroaniline	X	X	
2,4-Dinitrophenol	X		X
4,6-Dinitro-2-methylphenol			X
Carbazole		X	
Pentachlorophenol	X		
3,3'-Dichlorobenzidine		X	
Di-n-octylphthalate		X	
Associated samples:	All listed	MW-02-17 MW-02-31	MW-02-17DL MW-03-22 MW-03-32

X - %RSD > 30% or %D > 25%; Estimate (J4) positive and non-detected (UJ4) results in the associated samples.

<u>Compound</u>	<u>Standard/Time</u>	<u>%RPD</u>	<u>Column</u>	<u>Associated Samples</u>
alpha-BHC	PEM01 11/15 11:32	30.0	DB-5	All samples
beta-BHC	PEM01 11/15 11:32	40.0	DB-5	All samples
Endrin	PEM01 11/15 11:32	34.0	DB-5	All samples
4,4'-DDT	PEM01 11/15 11:32	41.0	DB-5	All samples
Methoxychlor	PEM01 11/15 11:32	44.0	DB-5	All samples
beta-BHC	PEM02 11/15 20:11	30.0	DB-5	All samples
alpha-BHC	PEM01 11/15 11:32	30.0	DB-17	All samples
Endrin	PEM01 11/15 11:32	32.0	DB-17	All samples
4,4'-DDT	PEM01 11/15 11:32	39.0	DB-17	All samples
Methoxychlor	PEM01 11/15 11:32	44.0	DB-17	All samples

Therefore, all non-detected and positive alpha-BHC, beta-BHC, Endrin, 4,4'-DDT and Methoxychlor results are estimated (J20, UJ20).

DATA ASSESSMENT

6. SURROGATES/SYSTEM MONITORING COMPOUNDS (SMC):

All samples are spiked with surrogate/SMC compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. If the measured surrogate/SMC concentrations were outside contract specifications, qualifications were applied to the samples and analytes as shown below. The following analytes for the samples shown were qualified because of surrogate/SMC recovery: All surrogate recoveries were within validation guidelines.

It should be noted that the incorrect percent recovery information appears on the raw data for the pesticide soil fractions. Recoveries were double those listed on the Form II's. No action is taken.

DATA ASSESSMENT

7. INTERNAL STANDARDS PERFORMANCE:

Internal Standard (IS) performance criteria ensure that the GC/MS sensitivity and response are stable during every experimental run. The internal standard area count must not vary by more than a factor of two (-50% to +100%) from the associated continuing calibration standard. The retention time of the internal standard must not vary by more than +/-30 seconds from the associated continuing calibration standard. If the area count is outside the (-50% to +100%) range of the associated standard, all of the positive results for compounds quantitated using that IS are qualified as estimated "J", and all non-detects as "UJ" only if IS area is <50%. Non-detects are qualified as "R" if there is a severe loss of sensitivity (<25% of the associated area counts).

If an internal standard retention time varies by more than 30 seconds, the reviewer will use professional judgment to determine either partial or total rejection of the data for that sample fraction. The following analytes in the samples shown were qualified because of internal standards performance: All internal standard criteria were met.

DATA ASSESSMENT

8. COMPOUND IDENTIFICATION:

A. VOLATILE AND SEMI-VOLATILE FRACTIONS

TCL compounds are identified on the GC/MS by using the analyte's relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within +/- 0.06 RRT units of the standard compound, and have an ion spectra which has a ratio of the primary and secondary m/e intensities within 20% of that in the standard compound. For tentatively identified compounds (TIC), the ion spectra must match accurately. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications. The following analytes in the samples shown were qualified for compound identification: No compounds were qualified due to compound identification.

B. PESTICIDE FRACTIONS

The retention times of reported compounds must fall within the calculated retention time windows for the two chromatographic columns. The percent difference (%) of the positive results obtained on the two GC columns should be <= 25%. The following analytes in the samples shown were qualified because of compound identification:

MW-02-17 - 4,4'-DDE (63.6%, JN25), 4,4'-DDD (87.5%, JN25 Over-calibrated), 4,4'-DDT (42.9%, J25 over-calibrated), alpha-chlordane (68.8%, JN25).

MW-02-17DL 4,4'-DDD (57.3%, JN25)

MW-02-31 - 4,4'-DDE (212.5%, R25), 4,4'-DDD (58.3%, JN25)

MW-03-22 - 4,4'-DDE (237.8%, R25), 4,4'-DDD (100.0%, R25), 4,4'-DDT (28.8%, J25)

MW-03-32 - 4,4'-DDD (48.8%, J25)

DATA ASSESSMENT

9. MATRIX SPIKE/SPIKE DUPLICATE, MS/MSD:

The MS/MSD data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD may be used in conjunction with other QC criteria for some additional qualification of data. The following analytes, for the samples shown, were qualified because of the MS/MSD:

There was insufficient sample to prepare an ABN matrix spike/matrix spike duplicate. Therefore, the MS/MSD was prepared using laboratory reagent. The %RPD for ABN matrix spike compound 1,2,4-Trichlorobenzene was greater than the CRR. No action is recommended.

It should be noted that the PEST MS/MSD was performed as batch QC. Gamma-BHC (42%) was outside of recovery limits in the MS and the %RPDs for gamma-BHC (72%), Heptachlor ((70%), Aldrin ((70%), Dieldrin (75%), Endrin (69%) and 4,4'-DDT (76%) were outside of control limits. There is no action taken as validation actions affect the native sample only.

It should be noted that the PEST samples were extracted on 10/23 and 10/26 without an associated blank spike. The blank spike submitted in the package was extracted on 10/20. No action is recommended.

DATA ASSESSMENT

10. OTHER QC DATA OUT OF SPECIFICATION:

VOLATILES: It should be noted that the laboratory reference spectra for Acetone was of poor quality. The m/z ion 58 was used to quantitate acetone (the SOP requests the 43 ion to be used for quantitation).

The Tentatively Identified Compound forms (1E and 1F) did not include the "JN" qualifier.

The response factors are not shown on the quantitation reports.

It should be noted that in the PEST analytical sequence, there are 13 hours between the analysis of the instrument blanks and standards. No action is recommended.

It should be noted that the unknown for TRIP BLK02 is not present and should not be reported.

It should be noted that there were no field duplicates associated with this SDG.

11. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT: Overall system performance was good.

12. CONTRACTUAL NON-COMPLIANCE: None

13. This package contains re-extraction, re-analysis or dilution. Upon reviewing the QC results, the following form I(s) and/or compounds are identified to be used:

ABN:

MW-02-17, MW-02-17DL

Use the positive results for the compounds Naphthalene and 2-Methylnaphthalene from the diluted analysis.

Use all other positive and non-detected results from the original analysis.

Pesticides:

MW-02-17, MW-02-17DL

Use 4,4'-DDD and 4,4'-DDT result from diluted analysis.

Use all other detected and non-detected results from the original analysis.

DATA ASSESSMENT

Tentatively Identified Compounds

<u>Compound</u>	<u>MW-02-17</u> ug/kg	<u>MW-02-31</u> ug/kg
VOA Unknown	XX(1050)	XX(19)

1,1-Dichloro-2,2-bis(p-chlor)	X(9200)	

X - Tentatively Identified Compound (TIC) of this description was found in the sample.

XX - Multiple TICs of this description were found in this sample.

Rejected Tentatively Identified Compounds are not included in this table.

CLP DATA ASSESSMENT

Appendix A.2: Data Assessment Narrative

Case No. 154598/678 SDG No. ANE290/678 Laboratory Envirotest Lab. Site Stewart ANG

Contractor Aneptek Reviewer Lorie MacKinnon

Matrix: 4 Soil

Data Assessment:

The SDG 154598/154678 contains the following samples for analysis:

Metals/CN: 4 soil/SDG ANE290 MW-02-17, MW-02-31, SDG NYG678 MW-03-22, MW-03-32

TOC: 4 soil/MW-02-17, MW-02-31, MW-03-22, MW-03-32

It should be noted that there are no field duplicates or field blanks associated with the samples in this SDG.

The current Functional Guidelines for evaluating inorganic data have been applied.

2.1 Validation Flags

The following flags have been applied in red by the data validator and must be considered by the data user.

J, UJ - This flag indicates the result qualified as estimated.

R - This flag indicates an unusable value. The rejected data are known to contain significant errors based on documented information and must not be used by the data user.

Usable - The results that do not carry "J" or "R" are fully usable.
Data

2.2 The Data Assessment

The inorganic data were evaluated based on the following parameters:

- * . Data Completeness
- * . Holding times
- * . Calibration verification results
- * . Blank analysis
- * . Interference check standard results
- * . Matrix spike results
- * . Duplicate analysis results

- NA . Field duplicate analysis
- * . Laboratory control sample results
- . Furnace AA results
- . ICP serial dilution results
- . Detection limit results
- * . Calculation and transcription checks

* - all criteria were met for this parameter.

NA - Not applicable.

Validation actions were taken based on the following information:

Calibration Verification

ANE 290

The 2xCRDL standard for Antimony was under-recovered at 77.3%. Results near the CRDL may be biased low. Estimate positive and non-detected (J2, UJ2) Antimony results which are less than 4xCRDL of 48 mg/kg or 240 ug/L. Based on this action level, Antimony results for samples MW-02-17 and MW-02-31 are estimated.

The CRA standard for Lead was over-recovered at 123.7%. Results near the CRDL may be biased high. Estimate (J2) positive Lead results which are less than 2xCRDL of 1.2 mg/kg or 6 ug/L. However, as the sample lead results are greater than this level, there is no action.

NYG678

The 2xCRDL standard for Chromium was over-recovered at 136.2%. Results near the CRDL may be biased high. Estimate positive (J2) Chromium results which are less than 4xCRDL of 8 mg/kg. Based on this action level, no actions are taken.

The CRA standard for Selenium was over-recovered at 143.4%. Results near the CRDL may be biased high. Estimate (J2) positive Selenium results which are less than 2xCRDL of 2.0 mg/kg. However, as the sample Selenium results were undetected, there is no action.

It should be noted that the low standard of 5 ug/L was used for the Lead calibration, instead of the CRDL of 3 ug/L. As all lead results are greater than 5X the CRDL, there is no action.

Matrix Spike Recoveries

ANE290

Antimony (50.2%), Lead (133.9%) and Thallium (52.3%) were recovered outside of the control limits in the matrix spike performed on sample SB-05-02. Due to

a possible low bias, all Antimony and Thallium results are estimated (J5, UJ5). Due to a possible high bias, all positive Lead results are estimated (J5).

NYG678

Antimony (50.5%), Selenium (64.5%), Manganese (169.8%) and Thallium (66.3%) were recovered outside of the control limits in the matrix spike performed on sample MW-03-22. Due to a possible low bias, all Antimony, Selenium and Thallium results are estimated (J5, UJ5). Due to a possible high bias, all positive Manganese results are estimated (J5).

Laboratory Duplicate Analysis

It should be noted that the Lead results for SDG NYG678 were found with the "*" qualifier, indicating poor duplicate precision. The %RPD was found to be below 20%. The validator therefore removed the "*" qualifiers from the Lead results.

Furnace AA Results

Furnace AA QC data were reviewed. Duplicate injections and one-point analytical spikes were performed for each sample and analyte. All duplicate injections agreed within +/- 20%. Spike recoveries met the 85 - 115% recovery criteria for all samples with the following exception:

<u>Analyte</u>	<u>Sample ID</u>	<u>Recovery</u>	<u>Action</u>
Selenium	MW0332	80.8%	J10, UJ10
Thallium	MW0217	81.6%	J10, UJ10
Thallium	MW0231	77.7%	J10, UJ10
Thallium	MW0322	80.3%	J10, UJ10
Thallium	MW0332	73.9%	J10, UJ10

ICP Serial Dilution

ANE290

A serial dilution was performed on sample SB-05-02. For initial concentrations greater than 10XIDL, the following %Ds were greater than 10% : Potassium (24.5%) and Zinc (19.6%). As 10XIDL was less than the CRDL in all cases, all Potassium and Zinc results greater than the CRDL are estimated (J12). Based on the sample levels, the Zinc results for the SDG samples and the Potassium result for sample MW-02-31 are estimated.

NYG678

A serial dilution was performed on sample MW-03-22. For initial

concentrations greater than 10XIDL, the following %Ds were greater than 10% : Potassium (25.5%). As 10XIDL was less than the CRDL, all Potassium results greater than the CRDL are estimated (J12). Based on the sample levels, there are no actions.

Detection Limit Results

It should be noted that ICP sample MW-02-31 was diluted (2X) as the Iron level exceeded the calibration range. The diluted results for all ICP analytes were reported, thus elevating the instrument detection limits (IDL) for all ICP analytes for the samples. A prescan was performed with the samples undiluted, however the laboratory did not submit it in the data package according to the SOW. No action is taken, as the non-detected results were less than the CRDL in all cases.

It should be noted that the Selenium and Thallium results for samples MW-02-17 and MW-02-31 were reported down to the wrong instrument detection limits. The raw data and Form 10s were reviewed the Form I results were edited.

CLP DATA ASSESSMENT

Appendix A.4: CLP Data Assessment Result Forms:

Spreadsheets containing the validated sample results are found at the end of the report.

Appendix A.5:

- 1 - Data has no problems/or qualified due to minor problems.
- 2 - Data qualified due to major problems.
- 3 - Data unacceptable.
- 4 - Problems, but do not affect data.

DATA VALIDATION RECOMMENDATION FOOTNOTES - ORGANICS

- J1, UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and non-detects (UJ1). Holding times have been grossly exceeded: reject all non-detects (R1).
- J2, R2 The initial or continuing calibration RF was low: estimate positive results (J2) and reject non-detects (R2).
- J4, UJ4 The initial calibration %RSD was greater than 30% or the continuing calibration %D was greater than 25%: estimate positive results (J4) and non-detects (UJ4).
- U5 Compound was present in the associated blank. Compound is present in the sample at a concentration less than the CRQL: report the CRQL (U5).
- U6 Compound was present in the associated blank. Compound was present in the sample at a concentration higher than the CRQL but lower than the "action level": qualify the result by reporting the value followed by "U" (U6). (i.e., the limit of detection has been raised for that compound, and the result is considered to be non-detect.
- J7 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was greater than the Contract Required Recovery Range (CRR): estimate positive results within that area of the chromatogram (J7).
- J8, UJ8 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was less than the CRR: estimate positive results (J8) and non-detects (UJ8) within that area of the chromatogram.
- J9, R9 One of more of the surrogate standard % recoveries was less than 10%: estimate positive results (J9) and reject non-detects (R9) within that area of the chromatogram.
- J10 The matrix spike (MS) and/or matrix spike duplicate (MSD) % recoveries were not within the CRR for this compound: estimate positive results in the unspiked sample (J10).
- J11, R11 The MS and/or MSD % recoveries were less than 10% for this compound: estimate positive results in the unspiked sample (J11) and reject non-detects (R11).
- J12 The MS/MSD %RPD for this compound was high: estimate positive results in the unspiked sample (J12).
- J13 Field duplicate %RPD was high for this compound: estimate positive results for this compound in the sample and duplicate (J13).

- J14 One or more of the Internal Standard (IS) areas were detected above the CRR; estimate the positive results for all compounds quantitated from that IS.
- J15, UJ15 One or more of the Internal standard (IS) areas was less than the CRR: estimate positive results (J15) and non-detects (UJ15) for all compounds quantitated from that IS.
- J16, R16 One or more IS areas were grossly low: estimate (J16) positive results and reject (R16) non-detects for all compounds quantitated from that IS.
- J/NJ17, R17 % Breakdown for DDT exceeded 20%: estimate positive results for DDT (J17), DDD, and DDE (NJ17) in all associated samples. If no DDT is present, but DDD and/or DDE are present: reject the CRQL (R6) for DDT. Qualify positive results for DDD and/or DDE as presumptively present at an estimated quantity (NJ17).
- J/NJ18, R18 % Breakdown for endrin exceeded 20%: estimate positive results for endrin (J18). If no endrin is present, but endrin ketone and/or endrin aldehyde are present: reject the CRQL (R7) for endrin. Qualify positive results for endrin aldehyde and endrin ketone (NJ18) as presumptively present at an estimated quantity.
- J/UJ19, R19 Initial calibration %RSD for this compound exceeded 20%: estimate positive and non-detected results (J19, UJ19) for this compound in associated samples. If %RSD exceeded 90%, flag all non-detected results as unusable (R8).
- J/UJ20, R20 Continuing calibration %RPD for this compound exceeded 25% (quantitation or confirmation column): estimate positive and non-detected results (J20, UJ20) for this compound in associated samples. If %RPD exceeded 90%, flag all non-detected results as non-usable (R9).
- J21 Compound reported above calibration range, estimate result (J21).
- J22 The continuing calibration %D exceeded 25% for a surrogate standard compound: estimate (J22) positive results for all compounds associated with the out of control surrogate in the affected samples.
- J23 Surrogate %D >25% or %RSD > 30%, estimate positive results for compounds associated with the out of control surrogate.
- R24 The initial calibration %RSD or continuing calibration %D > 90%. Reject non-detects.
- J/NJ25, R25 Pesticide compound which has concentration values differing from 25 - 50% in its two analyses. Compound result is estimated. Dual column analysis %D is between 50 - 90%; compound result is qualified

as presumptively present at an approximated quantity (NJ25). Dual column %D is greater than 90%; the compound result is rejected (R10).

- R26 Reject non-detected result. Compound detected above the calibration range and could not be quantitated to be reported.
- R27 Isomer identified at the incorrect retention time in samples and/or standards. Reject positive and non-detected results.
- R28 Quality of Spectra submitted poor for compound in question: reject compound result.

DATA VALIDATION RECOMMENDATION FOOTNOTES - INORGANICS

- J/UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and reject non-detects (R1). Samples were improperly preserved prior to analysis; estimate positive results (J1) non-detects (UJ1).
- J/UJ2, R2 Linearity was poor near the CRDL (Low levels). Estimate or reject the results within an affected area based on the recovery of the CRDL standard.
- R3 The analyte was present in the associated blank above the CRDL. The sample result was less than the action level of 5X the maximum concentration found in any blank, and has been rejected. The associated blank had a value below the negative CRDL. Results less than ten times the CRDL are rejected.
- J/UJ4, R4 The ICS recovery of an element is outside of criteria. The reported results or detection limits are estimated or rejected based on the recovery of the interference check sample.
- J/UJ5, R5 The recovery of an element is outside of control limits in the matrix spike. The reported results or detection limits are estimated or rejected based on the recovery.
- J/UJ6 The RPD for laboratory duplicate sample analysis results exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ7 The RPD for the field duplicate analysis exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ8, R8 The LCS recovery for an element is outside of criteria. The reported results are estimated or rejected based on the laboratory control sample analyte recovery.
- J9 The %RSD of duplicate injections for GFAA analysis do not agree within +/- 20%, or the laboratory performed a single burn analysis. The sample results are estimated.
- J10, UJ10 The recovery of analytical spikes for GFAA analysis is outside of control limits. Positive sample results or detection limits are estimated.
- J11 The sample required an MSA which was not performed, was performed incorrectly, or the correlation was < 0.995. The positive results are estimated.
- J12, R12 The results of the ICP Serial Dilution analysis were outside of control limits for initial concentrations equal to or greater than 10XIDL. Analyte results greater than 10XIDL or CRDL are estimated or rejected based on %D.

- J13 The sample was less than 50% solids. Analysis using a method intended for soils might not give representative results. The results are estimated.
- J14, UJ14 Matrix spike not performed for analysis. Estimate results (J14, UJ14) based on lack of accuracy data.
- J15 Laboratory duplicate not performed for analysis. Estimate positive results (J18) greater than the CRDL based on lack of precision data.

CLP DATA ASSESSMENT

Functional Guidelines for Evaluating Organic Analysis

Case No. 159177 SDG No. AC177 Laboratory Envirotest Lab. Site Stewart ANG
Data Assessment:

The SDG AC177/159177 contains the following samples for analysis:

Volatiles: 10 aqueous/MW-01-0320, SW-02-0320, MW-13-0320, SW-12-0320, SW-03-0321, JMW-109-0321, MW-09-0321, MW-10-0321, JMW-108-0321, TB-01

Semi-volatiles: 9 aqueous/MW-01-0320, SW-02-0320, MW-13-0320, SW-12-0320, SW-03-0321, JMW-109-0321, MW-09-0321, MW-10-0321, JMW-108-0321

Pesticides/PCBs: 9 aqueous/MW-01-0320, SW-02-0320, MW-13-0320, SW-12-0320, SW-03-0321, JMW-109-0321, MW-09-0321, MW-10-0321, JMW-108-0321

Associated QC: SW-02-0320, SW-12-0320/Field duplicates
MW-13-0320 MS/MSD

The validation was performed according to the CLP Organics Data Review and Preliminary Review, Standard Operating Procedure Number HW-5, Revision 8, dated January 1992.

All data are valid and acceptable except those analytes which have been qualified with a "J" (estimated), "N" (presumptive evidence for the presence of the material), "U" (non-detects), "R" (unusable), or "JN" (presumptive evidence for the presence of the material at an estimated value). All action detailed on the attached sheets. Spreadsheets containing the validated sample results are found at the end of the report.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant QC problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Data reviewer: GC/MS by Elissa McDonagh Date: 05/07/96

Data reviewer: Pest/PCB by Lorie MacKinnon Date: 05/07/96

Verified By: Lorie MacKinnon Date: 05/07/96

DATA ASSESSMENT

1. HOLDING TIME:

The amount of an analyte in a sample can change with time due to chemical instability, degradation, volatilization, etc. If the specified holding time is exceeded, the data may not be valid. Those analytes detected in the samples whose holding time has been exceeded will be qualified as estimated, "J". The non-detects (sample quantitation limits) will be flagged as estimated, "UJ", or "R", if the holding times are grossly exceeded.

All holding times were met.

DATA ASSESSMENT

2. BLANK CONTAMINATION:

Quality assurance (QA) blanks, i.e., method, trip, field, or rinse blanks are prepared to identify any contamination which may have been introduced into the samples during the sample preparation or field activity. Method blanks measure laboratory contamination. Trip blanks measure cross-contamination of samples during shipment. Field and rinse blanks measure cross-contamination of samples during field operations. If the concentration of the analyte is less than five times the blank contaminant level (ten times for the common contaminants), the analytes are qualified as non-detects, "U". The following analytes in the samples shown were qualified with "U" for these reasons:

Blank Actions

- Value < CRQL; report CRQL followed by "U" (U5).
- Value > CRQL and < action level; report value followed by "U" (U6).
- Value > CRQL and > action level; report value unqualified.

A. Method blank contamination:

The VOA, ABN and PEST laboratory method blanks and instrument blanks contained the following maximum quantities of contaminants:

Associated samples: All aqueous in SDG

<u>Compound</u>	<u>Maximum</u>	<u>Action Level</u>
bis(2-ethylhexyl)phthalate	19 ug/L	190 ug/L

The action level value was compared to the sample values after application of the sample dilution factors and the following actions are recommended: Bis(2-ethylhexyl)phthalate in samples SW-02-0320, MW-130320, SW-12-0320, SW-03-0321, JMW-109-0321, MW-09-0321, MW-10-0321 and JMW-108-0321 should be reported as the CRQL followed by a "U5". Bis(2-ethylhexyl)phthalate in sample MW-01-0320 should be reported as the CRQL followed by a "U6" (i.e., the CRQL has been raised and the value is considered to be non-detected).

In addition to the TCL compounds, TIC compounds were noted in the ABN laboratory method blanks. The RT of the blank TICs were compared to the RTs of the TICs found in the associated samples, and where similarities were found, the sample TIC result was flagged with a J30 in the TIC table if the concentration of the compound was greater than 5 times the amount of the concentration in the blank and rejected (R30) on the form 1F if the concentration of the compound was less than 5 times the amount of the concentration in the blank.

B. Field or rinse blank contamination ("water blanks" or "distilled water blanks" are validated like any other sample)

It should be noted that there were no field/rinse/equipment blanks

Stewart ANG Base
SDG No: AC177/159177

Page 5

associated with the aqueous samples.

C. Trip blank contamination:

The trip blank sample was non-detected for all compounds.

DATA ASSESSMENT

3. MASS SPECTROMETER TUNING:

Tuning performance criteria are established to ensure adequate mass resolution, proper identification of compounds, and to some degree, sufficient instrument sensitivity. These criteria are not sample specific. Instrument performance is determined using standard materials. Therefore, these criteria should be met in all circumstances. The tuning standard for volatile organics is bromofluorobenzene (BFB) and for semi-volatiles is decafluorotriphenyl-phosphine (DFTPP).

If the mass calibration is in error, or missing, all associated data will be classified as unusable, "R". The following samples shown were qualified with "R" because of tuning: All tuning criteria were met.

DATA ASSESSMENT

4. CALIBRATION

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of giving acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument is giving satisfactory daily performance.

A. RESPONSE FACTOR

The response factor measures the instrument's response to specific chemical compounds. The response factor for the VOA/ABN Target Compound List (TCL) must be ≥ 0.05 in both the initial and continuing calibrations. A value < 0.05 indicates a serious detection and quantitation problem (poor sensitivity). If the mean RRF of the initial calibration or the continuing calibration has a response factor < 0.05 for any analyte, those analytes detected in environmental samples will be qualified as estimated, "J". All nondetects for those compounds will be rejected, "R". The following analytes in the samples shown were qualified because of response factor: None were qualified due to response factor.

DATA ASSESSMENT

5. CALIBRATION

A. PERCENT RELATIVE STANDARD DEVIATION (%RSD) AND PERCENT DIFFERENCE (%D):

Percent RSD is calculated from the initial calibration and is used to indicate the stability of the specific compound response factor over increasing concentration. Percent D compares the response factor of the continuing calibration check to the mean response factor (RRF) from the initial calibration. Percent D is a measure of the instrument's daily performance. Percent RSD must be < 30% and the %D must be < 25%. A value outside of these limits indicates potential detection and quantitation errors. For these reasons, all positive results are flagged as estimated, "J"; and non-detects are flagged "UJ". If the %RSD and %D grossly exceed QC criteria, non-detect data may be qualified "R".

For the PCB/PESTICIDE fraction, if %RSD of the initial calibration exceeds 20% for all analytes except to the two surrogates (which must not exceed 30% RSD), qualify all associated positive results "J" and non-detects "UJ". If the %RPD of the continuing calibration check is greater than 25%, positive and non-detected results are estimated "J, UJ".

The following analytes in the samples shown were qualified for %RSD, %D or %RPD:

VOA instrument "MSD", initial calibration 2/29/96:

COMPOUND	IC (2/29/96)	CC (03/26/96)
Acetone		X
Associated samples:	All listed	MW-01-0320, SW-02-0320, MW-130320, SW-12-0320, SW-03-0321, JMW-109-0321, MW-09-0321, MW-110-0321, JMW-108-0321, TB01

X - %RSD > 30% or %D > 25%; Estimate (J4) positive and non-detected (UJ4)
results in the associated samples.

DATA ASSESSMENT

6. SURROGATES/SYSTEM MONITORING COMPOUNDS (SMC):

All samples are spiked with surrogate/SMC compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. If the measured surrogate/SMC concentrations were outside contract specifications, qualifications were applied to the samples and analytes as shown below. The following analytes for the samples shown were qualified because of surrogate/SMC recovery:

The VOA surrogates Toluene-d8, Bromofluorobenzene and 1,2-Dichloroethane were over-recovered in sample MW-130320MS. The VOA surrogate Toluene-d8 was over-recovered in sample MW-130320MSD. Matrix interference is suspected. No action is required.

The PEST surrogates TCX and DCB were recovered outside of the control limits of 60 - 150% in the following samples:

<u>Sample</u>	<u>TCX(DB-5)</u>	<u>TCX(DB-17)</u>	<u>DCB(DB-5)</u>	<u>DCB(DB-17)</u>
MW-01-0320	42%	41%	50%	50%
MW-10-0321	42%	41%	50%	43%
MW130320	46%	49%	50%	47%
SW-02-0320	28%	25%	(60%)	55%

It is recommended to estimate positive and non-detected results (J8, UJ8) for those samples.

DATA ASSESSMENT

7. INTERNAL STANDARDS PERFORMANCE:

Internal Standard (IS) performance criteria ensure that the GC/MS sensitivity and response are stable during every experimental run. The internal standard area count must not vary by more than a factor of two (-50% to +100%) from the associated continuing calibration standard. The retention time of the internal standard must not vary by more than +/-30 seconds from the associated continuing calibration standard. If the area count is outside the (-50% to +100%) range of the associated standard, all of the positive results for compounds quantitated using that IS are qualified as estimated "J", and all non-detects as "UJ" only if IS area is <50%. Non-detects are qualified as "R" if there is a severe loss of sensitivity (<25% of the associated area counts).

If an internal standard retention time varies by more than 30 seconds, the reviewer will use professional judgment to determine either partial or total rejection of the data for that sample fraction. The following analytes in the samples shown were qualified because of internal standards performance: All internal standard criteria were met.

DATA ASSESSMENT

8. COMPOUND IDENTIFICATION:

A. VOLATILE AND SEMI-VOLATILE FRACTIONS

TCL compounds are identified on the GC/MS by using the analyte's relative retention time (RRT) and ion spectra. For the results to be a positive hit, the sample peak must be within ± 0.06 RRT units of the standard compound, and have an ion spectra which has a ratio of the primary and secondary m/e intensities within 20% of that in the standard compound. For tentatively identified compounds (TIC), the ion spectra must match accurately. In the cases where there is not an adequate ion spectrum match, the laboratory may have provided false positive identifications. The following analytes in the samples shown were qualified for compound identification: No compounds were qualified due to compound identification.

B. PESTICIDE FRACTIONS

The retention times of reported compounds must fall within the calculated retention time windows for the two chromatographic columns. The percent difference (%D) of the positive results obtained on the two GC columns should be $\leq 25\%$. The following analytes in the samples shown were qualified because of compound identification:

It should be noted that 4, 4'-DDD had a %D $>90\%$ in some samples. Based on validation protocol, a compound with a dual column %D greater than 90% should be rejected. However, upon review of the sample chromatograms, it appears that there is a interferant peak present which is slightly resolved on the DB-05 column. The laboratory is able to integrate and report the peaks separately, although due to the compression of the chromatogram, the validator was not able to check the accuracy of the integration. On the DB-17 column, however, it appears that the 4,4'-DDD and interferant peak co-elute and the two compounds are reported as 4,4'-DDD. Due to the discrepancy, the %D is high. The results with high %D are estimated as presumptively present at an approximated quantity (JN25) as the percent difference is due to the interferant area included in the DB-17 result.

It should be noted that both the 4,4'-DDD peak and interferant peak are within the DDD retention time window. At the request of the client, the laboratory performed an extra matrix spike consisting of 4,4'-DDD to confirm which peak was 4,4'-DDD.

MW-01-0320DL 4,4'-DDE (36.4%, J25)

SW-02-0320DL 4,4'-DDD (144.4%, JN25) There is peak co-elution on DB-17 column.

SW-12-0320DL 4,4'-DDD (85.6%, JN25)

Stewart ANG Base
SDG No: AC177/159177

Page 13

SW-03-0321	4,4'-DDD (71.4%, JN25)
JMW-109-0321	4,4'-DDT (36.4%, J25)
MW-09-0321	4,4'-DDD (36.8%, J25)
JMW-108-0321	4,4'-DDT (38.5%, J25)
	4,4'-DDD (166.7, JN25)

DATA ASSESSMENT

9. MATRIX SPIKE/SPIKE DUPLICATE, MS/MSD:

The MS/MSD data are generated to determine the long-term precision and accuracy of the analytical method in various matrices. The MS/MSD may be used in conjunction with other QC criteria for some additional qualification of data. The following analytes, for the samples shown, were qualified because of the MS/MSD: All recoveries were found to be within control limits.

DATA ASSESSMENT

10. OTHER QC DATA OUT OF SPECIFICATION:

VOLATILES: It should be noted that the laboratory reference spectra for Acetone was of poor quality.

The Tentatively Identified Compound forms (1E and 1F) did not include the "JN" qualifier.

The response factors are not shown on the quantitation reports.

The spectra for the detected Chloromethane in sample MW-09-0321 should have been cleaned before reported.

The validator changed one of the VOA tentatively identified compounds (form 1E) reported for sample SW-02-0320 and SW-12-0320.

The validator changed some of the ABN tentatively identified compounds (form 1F) reported for samples MW-01-0320, MW130320, SW-02-0320 and SW-12-0320.

The ABN sample prep and analysis summary form incorrectly listed the date of analysis for sample JMW-109-0321 as 03/27/96. The correct analysis date is 03/29/96.

It should be noted that the %RPDs for 4,4'-DDE (51.4%), 4,4'-DDD (73.2%) and 4,4'-DDT (82.8%) were high (58.5%) in the field duplicate pair SW-02-0320 and SW-12-0320. It is recommended to estimate (J13) 4,4'-DDT, 4,4'-DDE and 4,4'-DDD in the sample and duplicate.

11. SYSTEM PERFORMANCE AND OVERALL ASSESSMENT: Overall system performance was good.

12. CONTRACTUAL NON-COMPLIANCE: None

13. This package contains re-extraction, re-analysis or dilution. Upon reviewing the QC results, the following form I(s) and/or compounds are identified to be used:

Pesticides:

MW-01-0320, MW-01-0320DL

Use 4,4'-DDD and 4,4'-DDT result from diluted analysis.

Use all other detected and non-detected results from the original analysis.

Stewart ANG Base
SDG No: AC177/159177

Page 16

SW-02-0320, SW-02-0320DL

Use 4,4'-DDD and 4,4'-DDT result from diluted analysis.
Use all other detected and non-detected results from the original analysis.

SW-12-0320, SW-12-0320DL

Use 4,4'-DDD and 4,4'-DDT result from diluted analysis.
Use all other detected and non-detected results from the original analysis.

CLP DATA ASSESSMENT

Appendix A.2: Data Assessment Narrative

Case No. 159177 SDG No. ANE177 Laboratory Envirotest Lab.

Site Stewart ANG Contractor Aneptek Reviewer Lorie MacKinnon

Matrix: 18 aqueous

Data Assessment:

The SDG ANE177 contains the following samples for analysis:

Metals/CN: 18 aqueous/TMW-01-0320, TSW-02-0320, TMW-13-0320, TSW-12-0320, TSW-03-0321, TJMW-109-0321, TMW-09-0321, TMW-10-0321, TJMW-108-0321, DMW-01-0320, DSW-02-0320, DMW-13-0320, DSW-12-0320, DSW-03-0321, DJMW-109-0321, DMW-09-0321, DMW-10-0321, DJMW-108-0321 (Cyanide analysis on total "T" samples only)

Associated QC: TSW-02-0321/TSW-12-0321, DSW-02-0321/DSW-12-0321 Field duplicates
TMW-13-0320 and DMW-13-0320 MS/DUP

It should be noted that the laboratory assigned samples TJMW-108-0321 and DMW-108-0321 the shortened Form 1 IDs TJM110 and DJM110.

The validation was performed according to the Evaluation of Metals Data for the Contract Laboratory Program, Standard Operating Procedure Number HW-2, Revision 11, dated January 1992.

2.1 Validation Flags

The following flags have been applied in red by the data validator and must be considered by the data user.

J, UJ - This flag indicates the result qualified as estimated.

R - This flag indicates an unusable value. The rejected data are known to contain significant errors based on documented information and must not be used by the data user.

Usable - The results that do not carry "J" or "R" are fully usable.
Data

2.2 The Data Assessment

The inorganic data were evaluated based on the following parameters:

- * . Data Completeness
- * . Holding times
- * . Calibration verification results
- * . Blank analysis
- * . Interference check standard results
- * . Matrix spike results
- * . Duplicate analysis results

* - all criteria were met for this parameter.

Validation actions were taken based on the following information:

Data Completeness

It should be noted that the Cyanide distillation logbook does not contain a section for the Ph of samples before distillation. No action was taken, as the chain of custody lists the proper preservative.

Calibration Verification

03/27/96 Total analysis

The CRDL standard for Chromium was over-recovered at 121.4%. Results near the CRDL may be biased high. Estimate (J2) positive Chromium results which are less than 4xCRDL of 40 ug/L. As chromium was non-detected, there are no actions.

The CRDL standard for Silver was over-recovered at 132.4% and 147.2%. Results near the CRDL may be biased high. Estimate (J2) positive Silver results which are less than 4xCRDL of 40 ug/L. As silver was non-detected, there are no actions.

03/27/96 Dissolved analysis

The CRDL standard for Silver was over-recovered at 128.6% and 127.6%. Results near the CRDL may be biased high. Estimate (J2) positive Silver results which are less than 4xCRDL of 40 ug/L. As silver was non-detected, there are no actions.

Matrix Spike Recoveries

Selenium (-134.9%) was recovered outside of the control limits in the matrix spike performed on total metals sample TMW-13-0320. Due to a possible low bias, all Selenium results are rejected (R5) for total metals samples in the SDG.

Selenium (56.7%) was recovered outside of the control limits in the matrix spike performed on dissolved metals sample DMW-13-0320. Due to a possible low bias, all Selenium results are estimated (J5, UJ5) for dissolved metals samples in the SDG.

Laboratory Duplicate Analysis

Laboratory duplicates were performed for both total and dissolved samples. The sample and duplicate levels were below five times the CRDL for total Chromium and the difference between the sample and duplicate was greater than the CRDL. Therefore, the total chromium results are estimated (J6, UJ6). The sample and duplicate levels were below five times the CRDL for total Selenium and the difference between the sample and duplicate was greater than the CRDL. The total Selenium results would be estimated (J6, UJ6). However, as the total Selenium results were previously rejected due to matrix spike recoveries, the action is noted only.

Field Duplicates

The %RPDs for Mercury (200%) and Zinc (56.3%) in the field duplicate pair of TSW-02-0321 and TSW-12-0321 was outside of the control limits. It is recommended to estimate (J7, UJ7) all Mercury and Zinc results for the total metals analysis samples.

ICP Serial Dilution

A serial dilution was performed on sample DMW-13-0320. For initial concentrations greater than 10XIDL, the following %Ds were greater than 10% : Zinc (11.4%). As 10XIDL was less than the CRDL, all dissolved Zinc results, greater than the CRDL, are estimated (J12).

Furnace AA Results

Furnace AA QC data were reviewed. Duplicate injections and one-point analytical spikes were performed for each sample and analyte. All duplicate injections agreed within +/- 20%. Spike recoveries met the 85 - 115% recovery criteria for all samples with the following exceptions:

<u>Analyte</u>	<u>Sample ID</u>	<u>Recovery</u>	<u>Action</u>
Arsenic	DMW-01-0320	84.8%	J10
Arsenic	DSW-03-0321	117.5%	U, No Action
Lead	TSW-02-0320	82.3%	UJ10
Lead	DSW-12-0320	77.6%	UJ10
Lead	DSW-03-0321	81.3%	UJ10
Selenium	TMW-13-0320	81.2%	(J10) Previously rejected
Selenium	TMW-01-0320	72.1%	(UJ10) Previously rejected
Selenium	TSW-02-0320	55.5%	(UJ10) Previously rejected
Selenium	TSW-12-0320	60.9%	(UJ10) Previously rejected
Selenium	TSW-03-0321	57.4%	(UJ10) Previously rejected
Selenium	TJMW-109-0321	80.3%	(UJ10) Previously rejected
Selenium	TMW-09-0321	75.5%	(UJ10) Previously rejected
Selenium	TMW-10-0321	52.2%	(UJ10) Previously rejected
Selenium	DMW-01-0320	77.3%	J10
Selenium	DSW-02-0320	82.7%	UJ10
Selenium	DMW-13-0320	59.9%	UJ10
Selenium	DSW-12-0320	84.2%	UJ10
Selenium	DSW-03-0321	47.4%	UJ10
Selenium	DJMW-109-0321	72.6%	UJ10
Selenium	DMW-09-0321	78.2%	UJ10
Selenium	DMW-10-0321	82.1%	UJ10
Selenium	DJM-108-0321	65.9%	UJ10
Thallium	DMW-13-0320	124.5%	U, No Action
Thallium	DJMW-109-0321	120.9%	U, No Action
Thallium	DJM-108-0321	118.1%	U, No Action
Thallium	TMW-13-0320	116.5%	U, No Action

Total and Dissolved Metals comparison

A comparison of the total and dissolved metals results was performed. If the concentration of any dissolved analyte was greater than its total concentration by more than 10%, both were estimated (J17). If the concentration of any dissolved analyte was greater than its total concentration by more than 50%, both were rejected (R17). The following table lists the analytes out of control limits in the sample pairs.

<u>Sample Pair</u>	<u>Analyte</u>	<u>%Greater</u>	<u>Action</u>
TSW-03-0321/DSW-03-0321	Zinc	13.4%	J17
	Copper	32.9%	J17
TJMW-109-0321/DJMW-109-0321	Zinc	28.7%	J17
TMW-09-0321/DMW-09-0321	Zinc	113.1%	R17

- 1 - Data has no problems/or qualified due to minor problems.
- 2 - Data qualified due to major problems.
- 3 - Data unacceptable.
- 4 - Problems, but do not affect data.

DATA VALIDATION RECOMMENDATION FOOTNOTES - ORGANICS

- J1, UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and non-detects (UJ1). Holding times have been grossly exceeded: reject all non-detects (R1).
- J2, R2 The initial or continuing calibration RF was low: estimate positive results (J2) and reject non-detects (R2).
- J4, UJ4 The initial calibration %RSD was greater than 30% or the continuing calibration %D was greater than 25%: estimate positive results (J4) and non-detects (UJ4).
- U5 Compound was present in the associated blank. Compound is present in the sample at a concentration less than the CRQL: report the CRQL (U5).
- U6 Compound was present in the associated blank. Compound was present in the sample at a concentration higher than the CRQL but lower than the "action level": qualify the result by reporting the value followed by "U" (U6). (i.e., the limit of detection has been raised for that compound, and the result is considered to be non-detect.
- J7 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was greater than the Contract Required Recovery Range (CRR): estimate positive results within that area of the chromatogram (J7).
- J8, UJ8 One or more of the surrogate standard % recoveries (in the case of pesticides, both DCB and TCX) was less than the CRR: estimate positive results (J8) and non-detects (UJ8) within that area of the chromatogram.
- J9, R9 One of more of the surrogate standard % recoveries was less than 10%: estimate positive results (J9) and reject non-detects (R9) within that area of the chromatogram.
- J10 The matrix spike (MS) and/or matrix spike duplicate (MSD) % recoveries were not within the CRR for this compound: estimate positive results in the unspiked sample (J10).
- J11, R11 The MS and/or MSD % recoveries were less than 10% for this compound: estimate positive results in the unspiked sample (J11) and reject non-detects (R11).
- J12 The MS/MSD %RPD for this compound was high: estimate positive results in the unspiked sample (J12).
- J13 Field duplicate %RPD was high for this compound: estimate positive results for this compound in the sample and duplicate (J13).

- J14 One or more of the Internal Standard (IS) areas were detected above the CRR; estimate the positive results for all compounds quantitated from that IS.
- J15, UJ15 One or more of the Internal standard (IS) areas was less than the CRR: estimate positive results (J15) and non-detects (UJ15) for all compounds quantitated from that IS.
- J16, R16 One or more IS areas were grossly low: estimate (J16) positive results and reject (R16) non-detects for all compounds quantitated from that IS.
- J/NJ17, R17 % Breakdown for DDT exceeded 20%: estimate positive results for DDT (J17), DDD, and DDE (NJ17) in all associated samples. If no DDT is present, but DDD and/or DDE are present: reject the CRQL (R6) for DDT. Qualify positive results for DDD and/or DDE as presumptively present at an estimated quantity (NJ17).
- J/NJ18, R18 % Breakdown for endrin exceeded 20%: estimate positive results for endrin (J18). If no endrin is present, but endrin ketone and/or endrin aldehyde are present: reject the CRQL (R7) for endrin. Qualify positive results for endrin aldehyde and endrin ketone (NJ18) as presumptively present at an estimated quantity.
- J/UJ19, R19 Initial calibration %RSD for this compound exceeded 20%: estimate positive and non-detected results (J19, UJ19) for this compound in associated samples. If %RSD exceeded 90%, flag all non-detected results as unusable (R8).
- J/UJ20, R20 Continuing calibration %RPD for this compound exceeded 25% (quantitation or confirmation column): estimate positive and non-detected results (J20, UJ20) for this compound in associated samples. If %RPD exceeded 90%, flag all non-detected results as non-usable (R9).
- J21 Compound reported above calibration range, estimate result (J21).
- J22 The continuing calibration %D exceeded 25% for a surrogate standard compound: estimate (J22) positive results for all compounds associated with the out of control surrogate in the affected samples.
- J23 Surrogate %D >25% or %RSD > 30%, estimate positive results for compounds associated with the out of control surrogate.
- R24 The initial calibration %RSD or continuing calibration %D > 90%. Reject non-detects.
- J/NJ25, R25 Pesticide compound which has concentration values differing from 25 - 50% in its two analyses. Compound result is estimated. Dual

column analysis %D is between 50 - 90%; compound result is qualified as presumptively present at an approximated quantity (NJ25). Dual column %D is greater than 90%; the compound result is rejected (R10).

- R26 Reject non-detected result. Compound detected above the calibration range and could not be quantitated to be reported.
- R27 Isomer identified at the incorrect retention time in samples and/or standards. Reject positive and non-detected results.
- R28 Quality of Spectra submitted poor for compound in question: reject compound result.
- J29 The resolution between two adjacent compound peaks in the resolution check mixture was less than 60%. Estimate the positive results for compounds not adequately resolved.
- J30, R30 The TIC compound was detected in the blank. In the sample, the concentration of the TIC is greater than five times the concentration in the most contaminated associated blank. The sample TIC result is flagged J30, as the result may be biased high due to contamination. If the sample TIC concentration is less than five times the concentration found in the blank, the sample TIC result is rejected.

DATA VALIDATION RECOMMENDATION FOOTNOTES - INORGANICS

- J/UJ1, R1 Holding times have been exceeded: estimate positive results (J1) and reject non-detects (R1). Samples were improperly preserved prior to analysis; estimate positive results (J1) non-detects (UJ1).
- J/UJ2, R2 Linearity was poor near the CRDL (Low levels). Estimate or reject the results within an affected area based on the recovery of the CRDL standard.
- R3 The analyte was present in the associated blank above the CRDL. The sample result was less than the action level of 5X the maximum concentration found in any blank, and has been rejected. The associated blank had a value below the negative CRDL. Results less than ten times the CRDL are rejected.
- J/UJ4, R4 The ICS recovery of an element is outside of criteria. The reported results or detection limits are estimated or rejected based on the recovery of the interference check sample.
- J/UJ5, R5 The recovery of an element is outside of control limits in the matrix spike. The reported results or detection limits are estimated or rejected based on the recovery.
- J/UJ6 The RPD for laboratory duplicate sample analysis results exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ7 The RPD for the field duplicate analysis exceeded 50% (100% for soils) for this analyte. The reported results are estimated.
- J/UJ8, R8 The LCS recovery for an element is outside of criteria. The reported results are estimated or rejected based on the laboratory control sample analyte recovery.
- J9 The %RSD of duplicate injections for GFAA analysis do not agree within +/- 20%, or the laboratory performed a single burn analysis. The sample results are estimated.
- J10, UJ10 The recovery of analytical spikes for GFAA analysis is outside of control limits. Positive sample results or detection limits are estimated.
- J11 The sample required an MSA which was not performed, was performed incorrectly, or the correlation was < 0.995. The positive results are estimated.
- J12, R12 The results of the ICP Serial Dilution analysis were outside of control limits for initial concentrations equal to or greater than 10XIDL. Analyte results greater than 10XIDL or CRDL are estimated

or rejected based on %D.

- J13 The sample was less than 50% solids. Analysis using a method intended for soils might not give representative results. The results are estimated.
- J14 Matrix spike not performed for analysis or performed on a field blank. Estimate positive results less than four times the spike level added based on lack of accuracy data.
- J15 Laboratory duplicate not performed for analysis or was performed on field blank. Estimate positive results greater than the CRDL based on lack of precision data.
- J16 ICP serial dilution was not performed or was performed on field blank. Estimate results greater than 10XIDL or greater than the CRDL for which an ISD was not performed.
- J17, R17 A comparison of the total and dissolved analytes was performed. If the concentration of any dissolved analyte was greater than its total concentration by more than 10% both were estimated. If the concentration of any dissolved analyte was greater than its total concentration by more than 50% both were rejected.

APPENDIX N

**LETTERS FROM NYSDEC REGARDING,
SENSITIVE HABITATS AND WATER BODIES**

NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION
Wildlife Resources Center
700 Troy-Schenectady Road
Latham, NY 12110-2400

(518) 783-3932

August 23, 1995

Jeff Donovan
Aneptek Corporation
209 West Central Street
Natick, MA 01760

Dear Mr. Donovan:

We have reviewed the New York Natural Heritage Program files with respect to your recent request for biological information concerning the EPA Hazardous Waste Investigation at the Stewart Air National Guard Base, site as indicated on your enclosed map, located in the Town of New Windsor, Orange County, New York State.

We did not identify any potential impacts on endangered, threatened, or special concern wildlife species, rare plant, animal or natural community occurrences, or other significant habitats.

The absence of data does not necessarily mean that rare or endangered elements, natural communities or other significant habitats do not exist on or adjacent to the proposed site, but rather that our files currently do not contain any information which indicates the presence of these. Our files are continually growing as new habitats and occurrences of rare species and communities are discovered. In most cases, site-specific or comprehensive surveys for plant and animal occurrences have not been conducted. For these reasons, we cannot provide a definitive statement on the presence or absence of species, habitats or communities. This information should not be substituted for on-site surveys that may be required for environmental assessment.

This response applies only to known occurrences of rare animals, plants and natural communities and/or significant wildlife habitats. You should contact our regional office, Division of Regulatory Affairs, at the address on the enclosed list for information regarding any regulated areas or permits that may be required (e.g., regulated wetlands) under state law.

If this proposed project is still active one year from now we recommend that you contact us again so that we can update this response.

Sincerely,

Beth O'Neill

RE: Hazardous Waste Remediation Investigation Site
Town of Newburgh, Orange County

Dear Mr. Donovan:

In response to your August 4, 1995 letter be advised that there are no designated Wild, Scenic and Recreational rivers within a two mile radius of the identified location, at the Stewart National Guard Base. Also, streams and lakes in New York are classified (see enclosed guide) and listed in the Official Compilation of Codes, Rules and Regulations of the State of New York (6 NYCRR Part 800). In addition, all water bodies are protected from pollution by our Water Quality Regulations and some waterbodies, Class C(1) and higher, are also protected from physical disturbance.

Please feel free to make an appointment to come to our office and use our maps and regulatory books if you require more detailed information. You can contact me at (914) 256-3058.

Sincerely,

A handwritten signature in cursive script that reads "Wendy DuBois".

Wendy DuBois
Regulatory Services
